ACCIPITRES AND STRIGES:

BY
E. P. RAMSAY, LL.D., F.R.S.E., &c.
SECOND EDITION
WITH ADDITIONS BY A. J. NORTH, C.M.Z.S.

PRINTED BY ORDER OF THE TRUSTEES.
R. ETHERIDGE, JUNR.,
CURATOR.

SYDNEY: WILLIAM APPELEGATE GULLICK, GOVERNMENT PRINTER.

MEMORANDUM.

THE stock of the First Edition of the "Catalogue of the Australian Birds" (Pt. I, Accipitres—Pt. II, Striges) having become exhausted, a Second Edition was authorised by the Board of Trustees. The revision, with the addition of later references and facts, was entrusted to Mr. A. J. North, Ornithologist to the Australian Museum, but he has avoided altering the original matter as much as possible, under the circumstances.

R. ETHERIDGE, JUNR.,
Curator.

PART I
ACCIPITRES.

BY
E. P. RAMSAY.
1874.

SECOND EDITION WITH ADDITIONS BY

A. J. NORTH.
1898.

PREFACE TO THE FIRST EDITION OF PART I.

THIS Part I. of the Catalogue of Australian Birds contains a description of all the Species of the Accipitres or Diurnal Birds of Prey at present known to inhabit Australia—in all 28 Species—and a list of such as are contained in the collection of the Australian Museum.

E. P. R.

Sydney, 1876.

PREFACE TO THE SECOND EDITION OF PART I.

THE present Edition of Dr. E. P. Ramsay's "Catalogue of the Australian Birds in the Australian Museum, Part I. Accipitres," has had incorporated with it an Appendix prepared by the same author, and published in 1890. The synonymy and literary references to each species for the past twenty-one years have been added, and the measurements of a series of specimens, when available, are given in every instance in tabular form. Since the publication of the First Edition specimens of *Astur cruentus* and *Gypoictinia melanosternon* have been added to the collection. I have endeavoured to make as few changes in the nomenclature as possible, and with one or two exceptions it remains the same as in the First Edition. A few remarks of mine on some of the species are placed between square brackets.

A. J. N.

Sydney, 1898.

Introduction to the First Edition of Part I.

THE fine collection of the Australian Diurnal Birds of Prey now exhibited in our Museum contains, with one exception,* examples of all the species which at the present time are known to inhabit this vast continent. Even in so extensive an exhibition of but comparatively a small group, certain breaks arising from the absence of specimens to duly represent the varied stages of growth, still occur and interfere with the regularity of the series appropriate to each species.

In order then to render this descriptive Catalogue of our rap-torial birds as complete as possible, other collections have been carefully examined, and the additional information thus obtained has been embodied in the general text. In two or three instances where the specimens were very indifferent, or altogether wanting, recourse has been had for their description to the British Museum Catalogue of 1874, always in such cases pointing out the authorities relied on.

The total number examined of specimens belonging to this group (Diurnal Birds of Prey) amounted to over 250, of which 140, comprising 26 species, are in the Museum collection; and for this ample display we are chiefly indebted to the exertions of our talented late Collector and Assistant Curator, Mr. George Masters, now in charge of the Macleay Collection.

This Catalogue contains not only an account and description of all the known species of Diurnal Accipitres indigenous to this country, but exhibits clearly what examples are required as desiderata for the accomplishment of a perfect series of the group, even from the nestling to the adult in each species.† We call attention to these wants, and urge our friends to assist by their contributions towards the completion of our national collection.

E. PIERSON RAMSAY.

Sydney, 1876.

* The Black-breasted Buzzard, *Gypoictinia melanosterna*.

† NOTE.—A complete series of any species would be fairly represented by a male and female in each of the sections A, B, C, and D—

A	representing the adults in full plumage.
B	„ semi-adult.
C	„ the young.
D	„ the nestling.

Spilocircus jardinii, *Kaup, Isis*, 1847, p. 102.

Strigiceps jardinii, *Bonap. Consp. Av.* tom. i, p. 34 (1850.)

Adult female. Above pale bluish slate-colour; the crown of the head, cheeks, and ear-coverts broadly margined with bright deep chestnut; scapulars and wing-coverts with terminal spots of white, and a row of larger spots on either side of the shaft, on the body of the feather; shoulders deep rufous chestnut; wings bluish grey; anterior portion of primaries blackish, basal portion dark brown; secondaries narrowly edged at the tip with white; all barred with dark brown, the subterminal bar being the broadest; wings (underneath) light ashy grey; bars more distinct on the

inner webs, except of the first four primaries, which are freckled with brown and washed with pale rufous buff in some specimens; under primary-coverts whitish, crossed with brown bars and tinged with chestnut on the margins; upper tail-coverts deep ashy brown, tipped and transversely blotched on both webs with white, interspaces of the outer ones washed with deep chestnut; tail ashy grey, lighter on the basal margin of inner webs; all the feathers tipped with white, crossed with seven or eight blackish bands; under surface of tail lighter; facial ruff and neck bluish grey; chest ashy grey, washed with rufous and spotted with white; remainder of under surface of the body, under wing-coverts, and axillaries deep rufous chestnut, each feather with a row of round white spots on each web; the spots are largest on the abdomen, flanks and axillaries, and smallest on the thighs; under tail-coverts ashy grey near the end, and tipped with white, the spots forming oblong transverse white bars on some; cere olive; bill bluish horn-colour at base, culmen and tip black; tarsi olive; iris yellow. Total length 23 inches, wing 17·5, tarsi 3·9, middle toe 1·8, bill from posterior margin of cere 1·3, along the culmen, 1·5.

Adult male. The adult male is a little smaller in its measurements, but the same in plumage.

Young. "Above ashy brown, the feathers broadly margined with pale tawny buff; the head and lesser wing-coverts deep rusty, with a few central streaks of dark brown; sides of face and of neck, as well as facial ruff, similarly coloured, but with rather broader streaks of brown; primaries black, secondaries browner, with tawny buff tips; all the quills pale ashy below on inner web, washed with rufous and mottled with ashy brown near base of primaries, barred with the same colour on the secondaries, the primaries coppery-brown underneath towards their tips; upper tail-coverts white, washed with rufous, and having dark brown centres; tail sepia-brown, tipped with tawny buff and crossed with six bands of black, the subterminal one being the broadest; under surface of body pale tawny buff, inclining to white on abdomen and thighs, narrowly streaked with dark brown on the breast; the under wing-coverts coloured like the latter, but with rather broader streaks, the lower ones barred with ashy brown and pale tawny buff; axillaries brown, margined and notched with pale tawny."*

Nestling, Reg. No. A. 9317. "Taken from the nest December 23rd, 1879, Lachlan River, N.S.W.; about five weeks old."* Down on the head and neck dull ashy-grey, ear-coverts rufous, on the remainder of the under surface white, the ends of pin-feathers on the chest deep rufous, those on the flanks similar, but with a broad lanceolate shaft stripe; under tail-coverts

* Sharpe, Cat. Bds., Brit. Mus., vol. i, p. 63 (1874).

rufous; down on the legs white mixed with buff, a few buff pin-feathers showing through the down; on the nape, hind neck, back, scapulars and wing-coverts, rump and upper tail-coverts, the feathers are blackish at the base, broadly margined and tipped with rufous; quills and tail blackish-brown, margined with buff or rufous; under surface of the secondaries showing transverse bars as in the adult, nearly all the feathers tipped with down. Total length 15·5 inches, wing 8·3, tail 5, bill from forehead 3·4, from gape 1·5, from nostril 0·6, tarsus 3·5, mid-toe (s.u.) 1·75.*

Habitat.—Derby (N. W. Austr.), Port Denison, Wide Bay District, Dawson River, Richmond and Clarence Rivers Districts, New South Wales, Interior, Victoria, South and West Australia.

Adult male. "Above earthy brown; the nape and hind neck slightly streaked with buff, most of the dorsal feathers with central markings of darker brown; quills brown shaded externally with grey; the secondaries narrowly tipped with fulvous, all with more or less distinct remains of blackish, forming on some of the secondaries a distinct subterminal spot; upper tail-coverts white, on some of them a slight spot of pale rufous; tail ashy grey, tipped with white; the central feathers entirely grey, the exterior one gradually becoming more and more tawny rufous near the base, with a few dark brown mottlings; frontal and superciliary feathers dull whitish, not very distinct; sides of face and of neck dull rufous brown, streaked with dark brown; facial ruff rufous buff, streaked with blackish, and mottled with white; under surface of the body creamy white, with distinct streaks of pale rufous brown along the centre of the feathers, broader on the under wing-coverts and very narrow on the thighs and under tail-coverts; culmen pale greenish yellow; bill dark brown, bluish at the base; tarsi greenish white; feet yellowish buff; iris yellow. Total length 21.5 inches, culmen 1.5, wing 16.25, tail 9.8, tarsus 3.9." *

Progress towards maturity—light-coloured variety. Feathers on head and neck dark brown margined with buff or lightrufous, basal portion of the feathers white, which shows conspicuously on nape and hind neck; throat, chest, and facial ruff buff, each feather on throat narrowly, and those of the chest and ruff broadly centered with a dark brown stripe; ear-coverts and sides of the head dark brown tinged with rufous buff, a dark line down centre of each feather; lower portion of hind neck and between shoulders dark brown margined with rufous buff; scapulars above, back, and rump blackish brown, deeper towards end of each feather; a few of the scapulars having a narrow margin of buff, and a few of the rump feathers being tipped with rufous;

* Sharpe, *Cat. Bds. Brit. Mus.*, vol. i, p. 72 (1874).

upper tail-coverts white with a transverse blotch of pale rufous near their tip; exposed portions of tail feathers above ashy grey, all tipped with white and crossed with transverse bars of blackish brown; inner webs washed with rufous; outer webs of external feathers washed with same colour, but of a deeper tint towards base; under surface of tail feathers buff, the bars showing through indistinctly; general colour of wings above dark brown, feathers on shoulders margined with deep rufous, wing-coverts narrowly margined with buff; secondaries, primaries, and primary-coverts ashy grey, margined narrowly with white, their inner webs tinged with light rufous buff at the base, all crossed with a series of transverse blackish bars—indistinct only on the anterior portion of the primaries, which is of a blackish brown, the terminal bars the widest, forming a subterminal blotch of blackish brown; under surface of primaries and secondaries light ashy grey, having the basal portion of inner webs washed with rufous buff, dark bars of the upper surface distinctly showing through; axillaries and under wing-coverts light rufous buff strongly barred with deep rufous, shoulders underneath light rufous buff, each feather striped with deep rufous down the centre; chest and breast buff; abdomen, flanks, thighs, and upper tail-coverts rufous buff, deepest in tint on abdomen and flanks, each feather on chest and breast centered with a lanceolate stripe of dark brown, those of abdomen and flanks with a broad stripe, and those of thighs and under tail-coverts with a narrow stripe of rich rufous; bill black, cere greenish yellow; tarsi dark brown with a greenish tinge. Total length 21 inches, bill 1·3 inch, along the culmen 1·45, from anterior margin of nostril 0·75, wing from flexure 15·5 inches, tail 9·5, tarsi 3·83, middle toe 1·7, hind toe 0·8.

Young. Above uniform dark sooty brown; nape and hind neck tinged mesially with deep rufous buff; wings blackish, secondaries, and some of the wing-coverts and primaries, margined with light brown, shafts reddish brown; under surface of the wing dull dark brown, basal portion of inner webs of primaries light brown and washed with fulvous on the margins, small feathers on under surface of shoulders tipped with deep rufous; axillaries indistinctly lined transversely in certain lights; rump and upper tail-coverts dark blackish brown—the latter margined with fulvous, with the basal half buff tinged near the middle with pale fulvous; tail above dark brown, blackish brown at the tips, margined with buff, inner webs of nearly all the feathers mottled with rufous, and showing signs of indistinct blackish bars, external feathers becoming more and more strongly washed with tawny rufous; tail beneath light brown, margins of inner webs washed with rufous, more extensively on external feathers, tips of all dark brown, their margins washed with buff, shafts whitish;

whole of under surface of body very dark blackish brown tinged with chocolate in certain lights, centres of feathers darkest; flanks and abdomen washed with chocolate; thighs deep rufous; under tail-coverts blackish brown, a few tipped with fulvous; bill blackish brown; cere greenish yellow, legs and feet greenish white. Total length 20·5 inches, wing 15·3, tail 10, tarsi 3·8, middle toe 1·55, hind toe 0·8.

Habitat.—Derby (N. W. Austr.), Rockingham Bay, Wide Bay District, Dawson River, Richmond and Clarence Rivers Districts, New South Wales, Interior, Victoria, South Australia, Tasmania, New Zealand, Fiji, New Caledonia.

Adult female. Upper surface of body, wings, and the tail, bluish ashy grey, concealed portion of the feathers of the body and of the smaller scapulars white barred more or less with same tint; the side of the head and ear-coverts of a lighter tint; tips of the primaries darker, very narrowly margined with white, their inner webs tinged with ashy brown, obsolete bars visible in certain lights on outer webs of primaries and secondaries; central portions of the inner webs of these feathers crossed with dark ashy-grey bars; the basal portions and inner margins (except at the tips) white; the whole of the under surface of the wing, except the outer margin of the tips of the primaries past the notch (where it is ashy grey) is of a pure glistening white, the bars and marking of the upper surface distinctly showing through; shafts of the quills white below, dark reddish-brown above; small feathers on the margins of the shoulders, the chest, breast, axillaries, and flanks white, crossed by numerous narrow lines of light bluish ashy grey; sides of the neck barred like the chest but less distinctly; abdomen, thighs, and under tail-coverts, pure white; tail above, same as the back and wings, bluish ashy-grey, the tips of the feathers narrowly margined with white; the two centre tail feathers and the outer webs of the rest indistinctly, but the inner webs distinctly barred with a darker tint; the inner webs, which have a faint brownish tinge, are white at the base along the margin of the inner web, the shafts brown; under surface of tail glistening white, the bars and marking of the upper surface showing through distinctly on the inner webs, shafts white; bill and claws black; cere, base of bill, eyelids, legs and feet citron yellow; iris deep yellow; total length 20 inches, wing 12·9, tail 9·5, tarsus 3·4, hind toe 1·2, middle toe 2·1, bill from base of cere 1·3, along the culmen 1·45.

Adult male. Mr. Sharpe describes the male of this species as similar to the female, but smaller, and gives the following measurements:—"Total length 16·5 inches, culmen 1·2, wing 10·15, tail 7·8, tarsus 2·7"; and also mentions an adult female in the collection of the British Museum which has the "wing-coverts and tail tipped with whitish, and the bars on the breast, which are a little more distinct than in the specimen of the adult male he describes, mixed with brown, evidently the signs of immaturity. Total length 20 inches, wing 12·25, tarsus 2·95."

"A younger bird does not exhibit the whitish margins to the wing coverts, but has the markings on the chest more elongate, these, as well as the other pectoral markings, being broad and distinct and brownish in colour; iris brown."*

* Sharpe, *Cat. Bds., Brit. Mus.*, vol. 1, p. 118 (1874).

Young female. Above dull ashy brown, in some slaty brown; lower part of hind neck brown; wings ashy or slaty-brown above, white underneath, the tips of the primaries being ashy grey, and the basal portion of the inner webs of secondaries and some of the nearest scapulars barred with brown not quite across the feathers, under primary-coverts barred with brown; sides of the head and neck dull brown, concealed portion of the feathers barred; the upper tail-coverts and tail dull ashy brown, strongly barred with darker brown; shafts reddish-brown; under surface of tail, light grey almost white, the bars showing through; the whole of the under surface of the body white; chest, a few feathers on the breast, and the flanks, crossed with dull ashy brown or ashy grey bands, frequently wavy, or in some broadly hastate; sides of the face and neck, throat and chest white, crossed with a few narrow wavy or hastate markings of brown.

In apparently full grown but not full plumaged birds, the upper surface is ashy-grey instead of brown, and the chest and breast crossed with numerous wavy bracket-shaped (~~~~) bands of light ashy brown. The tail is always strongly barred in young birds.

Remarks. Both Mr. Gould (in his *Hand-book to the Birds of Australia*, vol. i, p. 38) and Mr. R. B. Sharpe (in the *British Museum Catalogue, Accipitres*, vol. i, p. 118) describe the male of this species as being similar in plumage to the female, but smaller. I can only say that during the last ten years having examined over fifty specimens of *A. cinereus* and *A. novæ-hollandiæ* from Tasmania and all parts of Australia from Adelaide to Cape York, I have never yet met with one male in any other than a *snow white* plumage; in size they differ considerably, some males being 21 inches in length, others only 14 inches, or perhaps less.

[I formerly shared with Dr. Ramsay the belief that the male of *Astur cinereus* was purely white,† but we have now undoubted adult males of this species which cannot be distinguished from the females except by their smaller size. Moreover, a male and female, shot at a nest containing eggs, near Dubbo, New South Wales, were precisely alike in colour. A male in the collection, probably a very old bird, has entirely lost the narrow transverse ashy bars on the under surface, except on the sides of the chest.]

Habitat.—Derby (N.W. Austr.), Cape York, Rockingham Bay, Port Denison, Wide Bay District, Dawson River, Richmond and Clarence Rivers Districts, New South Wales, Victoria, South Australia.

Adult male. The whole of the plumage is of a pure white; cere and legs, base of bill and eyelids, yellow; bill and claws black; iris carmine. Length 16·5 inches, wing 10·3, tail 7·5, tarsus 2·85, bill 1·1, culmen 1·3, hind toe 1', middle toe 1·7.

Adult female. Pure white as in the male, but much larger. Total length from 18·5 inches to 20·2, wing 12 to 12·2, tail 9·2 to 9·5, bill 1·3, culmen 1·5, tarsus 1·2 to 1·3.

Young. Upper surface ashy-brown, browner on the scapulars, concealed portions of all the feathers being white; face, sides of the head and neck, ear-coverts, and lower portions of the back, white, tipped and barred with ashy brown, lower part of hind neck, ashy brown, tinged with pale brown; margins of the shoulders tipped or barred with brown; primaries and secondaries dark brown, basal portion barred not quite across with darker brown, basal marginal half of inner webs white, secondary coverts above white tipped and barred with brown; wing coverts, secondaries, and some of the inner primaries margined with white at the tips; under surface of the wing pure white, the margins of the primaries at the tips ashy grey, crossbars of upper surface shining through; upper tail-coverts and rump white at the base, narrowly margined, and barred with brown; tail above ashy brown, a little lighter on the inner webs, base of which is white extending along the margin to near the tips; all the feathers barred with dark brown, shafts reddish, brown, barred with white on the centre two feathers; outer webs narrowly margined with white at the base; under surface of tail pure glistening white, the markings of the upper surface showing through; all the under surface white, throat having a narrow line down centre of many of the feathers, chest and flanks with a broader central line and a few transverse, bracket-shaped bars of brown; bill and claws black; base of bill, cere and legs, citron yellow; iris brownish yellow. Total length 14 inches, wing 9·5, tail 7·1, tarsus 2·1, bill 1·05, culmen 1·2.

Habitat. Cape York, Port Denison, Richmond, and Clarence River Districts, New South Wales, Victoria, South Australia, and Tasmania.

Astur novæ-hollandiæ, sub-sp. *leucosomus*, Ramsay, *Tab. List Austr. Bds.*, p. 1 (1888).

Adult male. The same in plumage as *Astur novæ-hollandiæ*, being "uniformly white like that species, but very much smaller; cere yellow; bill black; feet citron yellow; iris orange-yellow. Total length 12·3 inches, culmen 1·1, wing 7·8, tail 5·9, tarsus 2·25, middle toe 1·2. (*Mus Lugd.*)"

Hab. New Guinea and adjacent Islands.*

[I have never seen the specimen obtained in Torres Strait, and referred to by Dr. Ramsay in the Proceedings of the Linnean Society of New South Wales,† as belonging to this species. Neither can I find in the Museum or Dobroyde Collection any *adult* specimen of White Goshawk, from Cape York, agreeing in size with the smaller dimensions of *A. leucosomus*, from New Guinea. A young male, *A. novæ-hollandiæ*, from Cape York measures, total length 15 inches, wing 9·5, tail 7·4, bill 1·2, tarsus 2·6. An adult female in the Macleay Museum, from the same locality, shot by the Curator, Mr. George Masters, on the 18th of September, 1875, measures—total length 19·5 inches, wing 11·5, tail 8·8. This is only 0·7 inches smaller in wing measurement than our largest specimen from New South Wales. The smallest adult male of *A. novæ hollandiæ* we have in the collection at present was obtained at Cairns, North-eastern Queensland, and has the wing and tail feathers much worn at the tips; it measures—total length 14·8 inches, wing 9·5, tail 7·6. Dr. Sharpe's measurements of the type specimen of *A. leucosomus* (an adult male) are as follows—total length 12·3 inches, wing 7·8, tail 5·9, tarsus 2·25, middle-toe 1·2.]

Habitat. New Guinea and adjacent islands (Sharpe, Salvadori), Cape York, Islands of Torres Strait (Ramsay).

Astur maculosus, *Coles, Vict. Nat.*, vol. xiv., p. 43 (1897) *juv.*

Adult male. Above ashy brown, head, nape, shoulders, outer webs of secondaries and primaries bluish grey, inner webs light ashy grey, indistinctly barred with dark brown; a band across the hind neck vinous red, inclining to rufous, forming a collar wider on the sides of the neck, where it is of a deeper tint; rump and upper tail-coverts ashy brown; tail browner, indistinctly barred with darker brown; bars more distinct on the inner webs of the feathers, which are of a lighter tint, and tinged with fulvous at the base of the outer ones; under surface of the tail feathers light silvery grey, bars much more distinct on all except the outermost on either side; inner webs of the first three on either side washed with light rufous; thighs rufous, barred with narrow indistinct lines of white; under tail-coverts, flanks, and remainder of the under surface except the throat, deep dull rufous, crossed with numerous wavy narrow bars of white, each bar bounded above and below with a narrow line of ashy brown; throat whitish, mottled with numerous transverse bars of ashy brown, tinged with rufous nearest the chest; under surface of primaries ashy grey, tips dark brown, washed with fulvous or light rufous on basal portion, and freckled with dark brown; concealed portions of the feathers on the inner webs crossed with blackish bars, interspaces near the shafts white; secondaries light ashy brown, silvery, bars nearly obsolete; under surface of the wings and the axillaries light fulvous or nearly white, crossed with numerous bars of rufous, bounded below with ashy; behind the thighs is a patch of clear rufous tinging the adjoining upper tail coverts; cere greenish yellow; bill dark horn-colour at tip, and

culmen, greenish olive at base; legs and feet yellow, claws black; iris deep yellow. Total length 16 to 17.2 inches, wing 10.5, tail 7.5 to 8.5, tarsi 2.9 to 3.1, bill 0.9 to 1 inch.

Remark. In some apparently fully adult specimens the back is browner, the colour vinous red and less distinct, the under surface of the primaries washed with a deeper tint of light rufous, and the bars on quills and tail much more distinct.

Adult female. The same in plumage, but larger. Total length 17.5 to 20.5 inches, wing 12 to 12.3, tarsi 3.2 to 3.5, tail 9.5 to 10.5.

Progress towards maturity. The longitudinal stripes on the throat, chest, and breast become transverse, the whole of the under surface is crossed with narrow, wavy rufous bars, margined with dark brown, the whole of the upper surface of a uniform brown, without any rufous margins to the feathers; the head inclines to bluish slate-colour; few, if any, of the feathers on nape or hind neck show any white; the wings underneath become more and more washed with rufous, and the bars on the tail less distinct.

Young. Varying from ashy brown to dark brown above, all the feathers more or less edged with rufous; sides of head, face, and throat, with a dark brown stripe down centre of each feather; the basal portion of the feathers on the back of the head and nape white, showing conspicuously with the brown and rufous markings of those parts; wings and tail dark brown, the inner webs of the feathers pale rufous, except at the tips, all crossed with numerous transverse narrow bars of blackish brown, eighteen to twenty in number on the tail, twelve to fourteen on wings; secondaries and tail feathers tipped with fulvous or dirty white; inner webs of tail feathers between the bars, light rufous above; outer webs above, deep rufous at the base of the external feathers in some; under surface of the tail white, shining, the rufous tint and bars distinctly showing through; under surface of body white or nearly so; chest streaked with irregular shaped somewhat oval blotches of dark brown—in some specimens strongly tinged with rufous, many of the feathers having a concealed transverse blotch near their centre; breast, abdomen, flanks, and under tail-coverts broadly barred with dark brown or rufous bands, margined on either side with brown, and barred with narrow wavy markings of a similar tint; under surface of wings white tinged with fulvous, crossed with dark brown bars; cere, and bill at base bluish lead-colour; culmen dark bluish horn-colour; legs and feet yellowish; iris bright yellow. Total length sixteen to nineteen inches.

Nestling, Reg. No. B. 6432. "Taken from the nest December 6th, 1883, Darling River, Interior, N.S.W. About a fortnight old. Iris brown, cere light green; bill black; legs and feet yellow, claws lead colour"; length 6 inches; bill from forehead 0.7 inch, from gape 0.75, tarsus 1.65, mid toe (s.u.) 1. Body

covered all over with creamy-white down, longest on the head and nape; pin-feathers just beginning to show on the primaries.

Nestling, Reg. No. B. 10158. Taken from the nest November 24th, 1885, Ivanhoe, N.S.W. "Iris dark brown, eyelids, cere and gape greenish, bill dark horn colour, legs and feet yellow, claws light horn colour." Body covered with creamy-white down, longest on the head and breast; pin-feathers showing through the down of the primaries and secondaries. Total length 7 inches, tarsus 1·6.

Habitat. Derby (N.W. Austr.), Cape York, Rockingham Bay, Port Denison, Wide Bay District, Dawson River, Richmond and Clarence Rivers Districts, New South Wales, Interior, Victoria, South and West Australia, and Tasmania.

5. *Astur cruentus*.

The Chestnut-collared Goshawk.

Astur cruentus, Gould, *Pro. Zool. Soc.*, 1842, p. 113; *id. Ann. & Mag. Nat. Hist.*, vol. xi, p. 528; Gray, *Gen. Bds.*, vol. i, p. 28 (1845); Gould, *Bds. Austr.*, vol. i, pl. 18 (1848); *id. Handbk. Bds. Austr.*, vol. i, p. 43, sp. 18 (1865); Ramsay, *Proc. Linn. Soc., N.S.W.*, vol. ii, 2nd ser., p. 165 (1888); *id. Tab. List Austr. Bds.*, p. 1 (1888); Sharpe, *Index Gould's Works*, p. 21 (1893); Gurney, *jun.*, *Ibis*, 1893, p. 349.

Urospizia cruenta, Kaup, *Proc. Zool. Soc.*, 1867, p. 176.

Urospizias cruentus, Gurney, *Ibis*, 1875, p. 365.

Adult male. All the upper surface of the head, wings and their coverts, back, rump, and tail lead-blue with a slight shade of brown; a distinct rufous collar round the hind neck and

joining the chest; throat ashy-white, slightly mottled with bluish-grey, the remainder of the under surface, under wing- and tail-coverts barred alternately with narrow lines of rufous and white, the rufous bars the broader; tail ashy-white below with from twelve to fifteen narrow black bars on the feathers, the centre two having spots on the shaft-line showing remains of the cross-bars; primaries with twelve to fourteen blackish cross-bars, which in very old birds are broken and altogether obsolete at the tips of the feathers; the inner webs of the under surface of all the quills have a tinge more or less of fawn colour. Description from a freshly moulted specimen, bill bluish at the base, tip black, legs and feet dull-yellow, claws black. Towards the moulting season the plumage of the upper surface becomes bleached and is then of a dull-brown. Total length 13·5 inches, wing 9 inches, tail 7 inches, bill from forehead 1 inch, from nostril 0·6 inch, from gape 0·9 inch, tarsus 2·8 inch, mid. toe (s.u.) 1·3 inch.

The female is slightly larger and browner upon the upper surface, the collar is not so well-defined, and the chin and cheeks are mottled with brown. Total length 15 inches, wing 10·5 inches, tail 8 inches, bill from forehead 1·05 inch, from nostril 0·6 inch, from gape 1 inch, tarsus 2·9 inches; mid. toe (s.u.) 1·6 inch.

[None of our Australian Accipitres have puzzled ornithologists so much as the present species. Gould, who described and figured it under the name of *Astur cruentus* states in his Birds of Australia, that it is very common in Western Australia, particularly in the York district and at the Murray. Whether he was quoting from Gilbert's notes, or whether the statement was only a surmise on Gould's part it is impossible to say, but the fact remains that this species is undoubtedly the rarest of all our diurnal birds of prey. The late Mr. J. H. Gurney considered *A. cruentus* to be a synonym of *A. approximans*, a belief, also for many years, partly shared by Dr. Ramsay. Mr. George Masters did not meet with it on either of his collecting trips to Western Australia in 1863 and 1868. Mr. E. J. Cairn and the late Mr. T. H. Boyer-Bower spent over twelve months collecting at Derby, in the north-western part of that colony, and although both obtained several specimens of *A. approximans*, it was only a short time before the decease of the latter gentleman, that he was enabled to send a box to Dr. Ramsay for examination which contained examples of the true *A. cruentus*, of Gould. These were at that time the only known specimens obtained since Gould described the type nearly half a century before. Count Salvadori, who, however, has had the advantage of examining a typical specimen of Cuvier's *Falco torquatus* in the Leyden Museum, and which Temminck, in his description of this species in his

"Planches Coloriées," in 1823, states is found in Northern Australia, Timor, and the Moluccas, pronounces Gould's *A. cruentus*, identical with this species, and also *Nisus australis* in the Paris Museum, described by Lesson in 1831 from a specimen brought by Peron from West Australia. Count Salvadori also ranks *Astur sharpii*, of Ramsay, from Port Moresby, New Guinea, as a synonym of *A. torquatus*.^{*} Dr. Sharpe refers the New Guinea examples with the barred under tail-coverts to *A. cruentus*, of Gould, and considers them distinct from *A. torquatus*, of Cuvier, as the specimens of the latter in the British Museum collected by Dr. Wallace in East Timor have the under tail-coverts, white. Temminck's plate of the adult of this species also represents the under tail-coverts as greyish-white and unbarred. However closely the *Astur* from New Guinea, described by Dr. Ramsay under the name of *A. sharpii*, resembles the continental form, I cannot agree in regarding it as the same as *A. cruentus*, from North-west Australia. I have three adult specimens of *A. sharpii*, now before me, including presumed the type, and will point out where they differ from the latter species. The collar on the hind neck is paler and of a tawny-rufous, the under surface is tawny-red and is more numerous crossed with narrow transverse dull-white bars in the male, and ashy-grey on the breast in the female; in both sexes also a faint wash of tawny-red extends all over the mottled greyish-white throat. The under tail-coverts vary considerably; in the female they are dull-white, conspicuously barred with rufous; in one of the males the cross-bars are much narrower, and in the other they are reduced to narrow indistinct transverse lines. In a specimen of *A. cruentus*, from Derby (North-west Australia), the collar on the hind neck is darker and of a chestnut-red, the under surface is not so rich in colour as the New Guinea examples, being of a pale rufous, conspicuously barred with dull-white, these barrings being bordered above and below with a narrow line of dark-ashy as in *A. approximans*, there is no faint wash of rufous on the throat, and the under tail-coverts are similarly marked as the breast, with the exception of having the dull-white cross-bars very much broader. Although the New Guinea and North-west Australian birds can thus be distinguished from each other, and the name of *A. sharpii* is preoccupied by Oustalet, I do not care to suggest a new name for the *Astur* from New Guinea, as the variable character of the under tail-coverts tends to prove that Count Salvadori is correct in referring it to *A. torquatus*. If *A. australis* from West Australia is identical with *A. torquatus* from Timor, as stated by Count Salvadori, Lesson's name must rank as a synonym of the latter species, but if it is the same as

^{*} Salvadori, Aggiunte, Orn. Pap. et Molucc. pt. 1, p. 20 (1889).

Gould's *A. cruentus*, Lesson's specific name of *australis* must take precedence. As some doubt exists to which species the latter name was applied, I have for the present retained Gould's name of *A. cruentus* for the small Goshawk from North-west Australia.]

Habitat. North-west Australia.

Adult male. Upper surface of the body and wings (except the quills) bright rufous, duller on the head, brightest on the wing-coverts, shoulders, and upper tail-coverts, the feathers of the head and neck having a black stripe down the centre, all the others centered with black and broadly margined with bright rufous; the upper tail-coverts are ashy at the base and barred with dark brown, deepest near the tips of the feathers, which are

broadly margined with bright rich rufous, through which a narrow black shaft-line is produced from the subterminal bar. The spurious-wings, primaries and secondaries, dark ashy-brown, darkest at the ends of the primaries, all crossed with blackish-brown bars, darker and broader towards the tips of the feathers, the shafts light reddish-brown; the inner webs of a lighter brown, becoming white at the base, where they are thickly freckled and spotted with markings and broken bars of dark-brown. The secondaries very narrowly margined with white at the tips; under surface of primaries and secondaries ashy-white (*glistening white in certain lights*), crossed with dark ashy-brown bars, becoming broken up into spots and freckles at the base of the inner webs, some of which have their margins slightly tinged with light rufous; the outer series of the under wing-coverts ashy-white, crossed with ashy-brown bars, and washed with light rufous on the tips and margins, those nearest the scapulars having a black shaft-line, and remains of dark-brown bars; the rest of the under wing-coverts rich rufous, with a black shaft-stripe widening into an angular subterminal spot, and remains of blackish cross-bars; wing-coverts above dark ashy-brown, the outer series margined broadly on the outer, and slightly on the inner webs with rufous; the remainder ashy-brown at the base, blackish at the tips, and broadly margined with rich rufous, deepest in tint on the marginal feathers and shoulders; throat buff tinged with rufous, and having a narrow black stripe down the centre of each feather; sides of the face and ear-coverts dull dark brown, narrowly margined with buff, those nearest the sides of the neck tinged with rufous; the whole of the under surface of the body bright deep rufous, each feather (except the axillaries, thighs, and under tail-coverts) centered with a black streak, widest on the chest and breast, narrowing on the flanks, where it forms at the tips of the feathers a subterminal angular spot, almost obsolete or forming a narrow shaft-line only on the abdomen; tail below ashy-white (*glistening in certain lights*), crossed with bars of blackish-brown, the subterminal one broadest; upper surface of the tail dark, ashy-brown, crossed with (twelve or more) wavy bars of blackish-brown, the last deepest and broadest, the tips narrowly margined with white; inner webs of the lateral feathers almost white at the base, the bars broken, and the interspaces thickly mottled with dark ashy-brown; bill blackish horn colour, cere yellowish, iris deep yellow, legs and feet light yellow.

Total length 20 inches, wing 14·3, tail 9, tibia* 3·94, tarsus* 3, hind claw along the curve 1·35, across the curve 1·15; bill from forehead 1·1 inch, from gape 1·2, from nostril 0·7, height at nostril 0·5, width 0·45.

* Measurements taken from ad. ♂ sk. the ends of the bones laid bare.

Adult female. Similar in plumage to the male but a little larger. Total length 22 inches, wing 15·8, tibia* 4·34, tarsus* 3·3, hind claw along the curve 1·8, across the curve 1·4.

Habitat. Rockingham Bay, Wide Bay District, Dawson River, New South Wales, Interior.

Urospiza cirrhocephala, *Kaup. Proc. Zool. Soc.*, 1867, p. 176; *Gray, Hand-list. Bds.*, vol. i, p. 34 (1869).

Adult male. Above bluish ash-colour; head and wings slightly darker; sides of the face and ear-coverts lighter; a distinct collar of bright deep vinous red, broadest at the sides of the neck, where, in some specimens, a few of the feathers are also barred like those on the chest; basal portion of the nape feathers white; scapulars with concealed white spots, the lesser ones tinged and spotted in addition with vinous-red near the base; inner webs of secondaries, and of the primaries as far as the notch, ashy-brown; all crossed with dark ashy-brown bars, most conspicuous on the marginal basal portion of the inner webs, which is white or slightly shaded with pale rufous; tail above bluish ash-colour, inner webs having an ashy-brown tinge, crossed with dark ashy-brown bars; under surface light ashy-brown, whitish in certain lights, and the dark bars showing more distinctly; wings underneath light ashy-brown, whitish in certain lights; quills distinctly barred with dark brown, obsolete on outer webs; inner webs tinged and freckled with vinous red towards the base; under surface of shoulders and the under wing-coverts vary from buff to ashy-white, crossed with numerous narrow wavy bars of ashy-brown and vinous-red; throat ashy-white, with indistinct transverse bars of ashy-brown; under tail-coverts ashy-white, with remains of transverse bars of ashy-brown and vinous-red; chest and remainder of the under surface crossed with numerous narrow bars of ashy-brown, deep bright vinous-red, and white—the bars being broadest on the flanks and narrowest on the thighs; bill black, lead coloured at base, cere, legs, and feet yellowish, tinged with olive, iris yellow. Total length 12 inches, wing 8, tail 6,

tarsus 2·3, middle toe 1·3, its first joint 0·6, culmen 0·7. A very highly coloured male in the Museum collection, from King George's Sound, has the chest and flanks and thighs of a deep rich vinous-red, the cross-bars almost obsolete; the collar is of a much deeper tint than usual, but interrupted on the hind neck.

Adult female. Differs only in size, being a little larger and perhaps not so highly coloured as the male. Total length 14 inches, wing 9·35, tail 7, culmen 9, middle toe 1·55, its first joint 0·7.

Progress towards maturity. The longitudinal blotches on the chest widen into transverse bars, which gradually become narrower, the rufous markings develop into bars, and the brown becomes reduced into narrow conterminous lines; the white mottlings become less conspicuous on the back of the neck, and its sides tinged with rich vinous-red.

Young. Dark-brown above, with the feathers more or less margined with rufous; basal portions of the feathers on the nape and upper part of hind neck white, giving to those parts a mottled appearance; scapulars white at the base, barred with brown; the base of the feathers on the lower part of hind neck, back, and upper tail-coverts are ashy brown; quills of wings and tail dark-brown, margined with rufous at the tips, crossed with blackish-brown bars most numerous on the tail; the marginal half of the inner webs of the wing feathers at the base ashy-white, washed with pale rufous; same parts of the tail feathers light ashy-brown, tinged with rufous on the edges; shafts dull reddish-brown; under surface of the wings and tail ashy-white, the inner margins washed with pale rufous, except at the tips of primaries, which are ashy-brown past the the notch; all the under surface ashy-white, tinged with rufous on the thighs; throat white, with a stripe of dark-brown down centre of each feather; chest blotched with dark-brown, forming a triangular patch at the tip of each feather, which is centered with rufous; chest, breast, abdomen, flanks, and thighs, crossed with numerous transverse bands of dark-brown, the terminal band more conspicuously centered with rufous; the bands are narrowest and most numerous on the thighs; under tail-coverts sparingly barred with somewhat hastate markings of dark-brown; bill dark horn colour; base and cere greenish; feet and legs yellowish, greenish-grey in front; iris yellow.

Remark. The young females of this species are frequently confounded with the young males of *Astur approximans*, which they closely resemble in size and plumage. The *Accipiter's long middle*

toe, with its *long first joint*, its *shorter* and somewhat *square tail*, which never exceeds more than 7·6 inches, will at once distinguish them.

Habitat. Derby (N.W. Austr.), Cape York, Rockingham Bay, Port Denison, Wide Bay District, Dawson River, Richmond and Clarence Rivers District, New South Wales, Interior, Victoria, South and West Australia, Tasmania, New Guinea.

Aquila (Uroaetus) audax, *Ramsay, Proc. Linn. Soc., N.S.W.*, vol. ii, p. 177 (1877); *id. Tab. List Austr. Bds.*, p. i (1888).

Adult female. Above blackish-brown, all the feathers white at the base; hind neck and nape tawny-chestnut; median wing-coverts ashy-brown, centered with blackish; primaries black; remainder of the quill feathers of the wings and the tail blackish, crossed near the tips with ashy-brown bars, and margined with brown at the tips; the basal portion of the inner webs light-ash, almost white in the tail feathers, and mottled with white in those of the wings; the feathers of the back and rump all more or less tipped with fulvous-brown; upper tail-coverts light-brown, shaded with ashy on their margins. The whole of the under surface blackish-brown, each feather more or less distinctly tipped or margined with light-brown; under tail-coverts buffy-brown. Cere and orbits whity-brown; bristles black; bill pale horn-brown, black at the tip and for a short distance along the culmen; feet yellowish; claws blackish horn-colour; iris hazel. Total length, 3 feet 6 inches, tail 17, wing 25·7, bill from posterior margin of cere 2·6, from anterior margin of cere 2·7, height from culmen to lower margin 1·2; tarsus 4·8, hind toe 2·1, its claw 2·6, middle toe 3·3, its claw 1·7.

Adult male. Similar in plumage to the female, but seldom quite so large; deeper in tint of colouring, the nape, hind neck and median wing-coverts being bright rufous-chestnut.

Young. General colour rusty-red intermixed with dark-brown; crown of the head dark-brown, each feather tipped with rufous fawn-colour; nape and hind neck rufous-chestnut, lower part of hind neck paler, and shaded with dark-brown, in the centre tipped with fulvous; on the back and rump dark-brown, lighter near the tips, which are fringed with whitish down; the base of the feathers mottled with white and brown in the form of broken transverse bars; upper tail-coverts shaded with light and dark brown, lateral and terminal ones of fulvous, some with a subterminal spot of fulvous, and all finally fringed with whitish down, and mottled with white and brown broken transverse bars at the base; tail black above, dark brown below, whitish at the base of the feathers, towards the tips barred transversely with light brown and tipped with fulvous; under tail-coverts fulvous tipped with down of a paler tint; shoulders above rufous fawn-colour, mesially shaded with dark-brown; smallest wing-coverts dark-brown slightly tipped with light-rufous, median coverts fawn-colour, greater coverts blackish-brown, indistinctly barred with ashy-brown, mottled with white near the base of the feathers; primaries black, dark ashy-brown mottled with white at the base; secondaries and scapulars blackish-brown barred near the tips with ashy-brown, which colour predominates on those nearest the body, the basal interspaces on the inner webs being white; under surface of the shoulders to the angle of the wing dark-brown tipped with whitish, from thence to the base of the primaries, fulvous shaded with dark-brown; under primary coverts brown, washed with ashy-brown at the base; under surface of quills dark-brown, at the base washed with ashy and mottled with white; the secondaries, inner primaries, and scapulars all crossed more or less distinctly with ashy-brown bars; throat and remainder of the under surface blackish-brown; feathers on lower part of the neck and chest tipped with rufous-fawn, the remainder tipped with whitish-brown, and fringed with white down. In a much younger bird the whole of the feathers, including the wing and tail quills, are fringed with down at the tips.

Nestling, Reg. No. A. 18558. "Taken from the nest, about two or three days old. Iris dark brown, feet whitish. Locality Moolah, Interior, N.S.W., August, 1883." Total length 6 inches, bill from forehead 0.9, from gape 0.95; tarsus 0.8. Entirely covered with snow-white down, long on the thighs and legs, longest upon the head and hind neck where the down is erect and hairy.

Nestling, Reg. No. B. 6431. "Taken from the nest near Moss-giel, N.S.W., September 12, 1884." About a fortnight old, uniformly covered with white down, hairy in texture and longest on the head and hind neck, very short on the inner side of the thighs and under the wings. "Iris brown, bare place in front of the eyes lead colour; cere greenish-white; bill, horn-colour; black at the tip; gape yellow; feet white, claws light horn-colour, dark at the base. Total length 11 inches, wing 3, pin-feathers of the primaries just beginning to show through the down, tarsus 1·3, bill from forehead 1·4, from gape 1·5.

Nestling, Reg. No. B. 10145. "Taken from the nest September 30th, 1884; about two months old; iris clear light-brown, cere greenish-white; bill, basal half horn colour, remainder black; feet white." Total length 21 inches, wing 10 inches, tail 4·3, tarsus 3·5, mid. toe (s.u.) 2·5, bill from forehead 2·2, from gape 2·3. This specimen is covered with short white down, except on the wings and tail, where black pin-feathers mottled with rusty-brown appear; a small patch of narrow lanceolate feathers of dark rusty-brown on the base of the occiput; the tips of a few black feathers also appear through the down; the sides of the chest, breast, and the outer sides of the thighs and legs, and the upper and under tail-coverts rusty.

Nestlings, Reg. Nos. B. 6422, and B. 6423. Taken from the same nest, between three and four months old, have rufous feathers tipped with down developing on the head, hind neck, chest, wing-coverts, upper and under tail-coverts, primaries—as far as developed—black; secondaries and coverts dark-brown barred with black; tail blackish at the base barred with black and ashy-brown towards the tip; feathers of the lower part of the breast blackish-brown tipped with fawn colour; thighs and legs almost black tipped with light brown. A second specimen, a female is of the same dimensions and similarly marked. Total length 25·5 inches, wing 14, tail 7·7, tarsus 3·9, "iris clear light-brown; bill, horn colour at base, remainder black; cere bright yellow; feet yellowish, claws black, sex male. Mossgiel, October 13th, 1884."

Remarks. "As a rule this bird nests in the early part of July, and the young leave the nest about the end of November; young ones have been taken as early as the 10th of July, which were apparently about a week old, such instances of early breeding are however rare." (K.H.B.)

Habitat. Derby (N.W. Austr.), Gulf of Carpentaria, Cape York, Rockingham Bay, Port Denison, Wide Bay District, Dawson River, Richmond and Clarence Rivers Districts, New South Wales, Interior, Victoria, South and West Australia, Tasmania.

Adults. Both the male and the female vary considerably, both in size and in the intensity of the colouring and tints, in some the prevailing colour below being rufous brown, in others buff or white.

Adult female (the most usual variety). The whole of the head and neck, chest, breast, and flanks, dark-brown washed with tawny rufous or dull rust-red, each feather with a stripe of blackish-brown down the centre, which stripe becomes almost jet black on the crown of the head, nape, and sides of the face, and extends over the tips and greater portion of each feather; abdomen and thighs rufous-brown, with a narrow line of blackish down the shaft of each feather; under tail-coverts dull rufous-brown washed with ashy at the tips and freckled with ashy-brown and white (*in some* forming white cross-bars). Primaries blackish-brown, black at the tips, the inner four quills ashy-brown, margined with white at the tips, all crossed with seven or eight blackish bands, interspaces at the base ashy-white; secondaries varying from dark to light ashy-brown, lightest at the base of inner webs, all more or less tipped with white and barred similar to the primaries; wing-coverts of various shades of light and dark brown, some washed with ashy-brown, indistinct obsolete bars on most of them on the concealed portions, interspaces whitish; median coverts ashy-brown shaded mesially with darker tint, and margined with ashy-white, forming a light-coloured and more or less broad longitudinal band across the wing to the shoulder; larger scapulars dark blackish-brown, the basal half of the feathers becoming lighter, barred like the secondaries; smaller scapulars and remaining coverts lighter brown shaded mesially with darker, occasionally margined with ashy-white, as in the median coverts; all the wing feathers being white at the base; shoulders varying from dark to light brown, the feathers all more or less margined with ashy-white, the central portion darker, the marginal feathers brown washed with rufous, having a blackish shaft-line; under surface of the wings blackish-brown tinged with rufous near the body, the primaries and secondaries ashy-brown, lighter on the inner webs, the cross-bars of the upper surface showing through, the interspaces ashy-brown becoming white at the base, secondaries margined with white at the tips, tips of the primaries blackish-brown, shafts brown, white at the base; under surface of the scapulars ashy, inner webs ashy-white, bases white, bars indistinctly showing through on the larger feathers; back and rump dark-brown, shaded mesially with blackish-brown, feathers white at the base; central uppertail-coverts, blackish-brown, lateral ones ashy-brown washed with rufous nearest the thighs; terminal ones ashy-brown tipped with white, outer ones margined with white and occasionally crossed with whitish bars; tail above ashy-brown, inner webs of a duller brown, their bases white mottled with brown, all the feathers crossed with seven or eight curved bars of dark-brown, the last the darkest, the tips margined with ashy-white, shafts brownish, at the base white; tail below glistening ashy-white, two or three of the bars showing through near the tips;

cere lead-blue; bill bluish lead at base, black at the tip; iris reddish-brown; feet lead blue. Total length 22 inches, wing $15\frac{1}{2}$, tail $9\frac{3}{4}$, tarsus $2\frac{3}{4}$, bill $1\frac{1}{4}$.

A very remarkable variety, apparently fully adult, has the sides of the head and hind neck tawny rufous with a blackish stripe down the centre of each feather; the under wing-coverts and basal portions of the inner webs of the primaries below pure white, with a linear or lanceolate mark of brown or pale rufous, on the shaft or near the tips of the feathers; the axillaries and some of the under wing-coverts have two or three such marks, the terminal one being usually broadest; sides of the chest and flanks buff washed with light rufous, with a blackish-brown stripe down the centre of each feather; thigh and legs to the toes buff shaded with light rufous, under tail-coverts buff, abdomen white; the inner primaries above the secondaries and feathers of the longitudinal band across the wing are largely margined with whitish ash.

Adult male. In plumage similar to the females, but in size much smaller, they are usually darker in colour, and the abdomen, flanks, and thighs of a more uniform tint of rufous, the shaft lines always darker.

Nestling, Reg. No. B. 6429. "Taken from the nest, December 24th, 1883, just hatched." Total length 3·5 inches, bill from forehead 0·6, from the gape 0·65; covered with creamy-white down, erect and hairy upon the upper surface; "iris pale brown, cere yellowish, bill light horn colour, feet flesh colour."

Nestling, Reg. No. B. 10147. "Taken from the nest, November 5th, 1884, Mossgiel, New South Wales." Total length 4·5 inches; bill from forehead 0·85, from gape 0·9; slightly larger than the preceding; colouring the same. "Iris dark-brown, cere yellowish; bill dark horn colour; feet yellowish-white, claws light horn colour."

Nestling, Reg. No. B. 6427. "Taken from the nest, December 7th, 1883, Mossgiel, Interior, N.S.W." Total length 9·7 inches, wing 4·5, bill 1·2, from gape 1·3; covered with short white down below the head and the neck; interscapular region, scapulars, and the primaries blackish-brown; upper wing-coverts brown, tinged here and there with rufous-brown, the tips of a few rufous pin-feathers showing upon the sides of the chest. "Iris light brown, bill black, cere greenish; feet yellowish-white, claws black, bare space round the eyes dark lead colour."

Nestling, B. 10146. "Taken from the nest, December 4th, Mossgiel, New South Wales; iris clear light brown, cere yellowish, bill bluish horn colour at base, remainder black, bare space around the eyes lead colour, feet yellowish-white." Total length 12·5 inches, wing 6·2, bill from forehead 1·2, from gape 1·4, from nostril 0·7; similar to the preceding, the down very much shorter and the hairy portions worn off, a few rusty feathers

on the occiput, nape and interseapular region, those on the shoulders, scapulars, and back dull-brown, dark in the centre; primaries black, tipped with light-brown, a few brown feathers upon the rump and upper tail-coverts, pushing through the down, dark-brown; tail dark brown margined with ashy-white and tipped with white down; rufous tinge on some of the pin-feathers of the under tail-coverts; a few rufous feathers appearing on the sides of the breast and centre of the abdomen. "Iris clear light brown, cere yellowish, bill bluish horn colour, tip black; bare space in front and around the eyes lead colour, feet yellowish-white."

Nestling, Reg. No. B. 6428. Taken from nest, December 24th, 1883, Interior, N.S. Wales, about two months old, or more. "Iris light brown; bill horn colour at base, tip black; cere yellowish; feet greenish-white, claws black; bare space in front and around the eyes blackish." A much more advanced bird than the last. Total length 14 inches, wing 8·7, tail 4, bill from forehead 1·35, from gape 1·5, from nostril 0·75, tarsus 2·2, mid. toe (s.u.) 1·75. Rufous feathers on the head and nape covering the down, interseapular region brown, slightly tinged with rufous; wing-coverts dark-brown, shaded with ashy-brown and margined with ashy at the tips; primaries black, slightly tipped with ashy-white; secondaries dark brown, ashy at the tips showing blackish bars; on the under surface the bars on the secondaries are well-defined; chest, and all the under surface, sides, and under tail-coverts rufous, a few feathers only above the flanks fully developed; throat and sides of the neck with very short down.

Habitat. Port Denison, Wide Bay District, Dawson River, Richmond and Clarence Rivers Districts, New South Wales, Central Australia, West Australia.

Polioaetus leucogaster, *Gould, Handbk. Bds. Austr.*, vol. i, p. 13, sp. 3 (1865); *Ramsay, Proc. Zool. Soc.*, 1875, p. 578.

Adult female. The whole of the head and neck, and all the under surface of the body and under wing-coverts white, some of the lateral wing-coverts shaded with ashy-grey on the outer webs, the greater coverts, ashy-grey becoming white at the base, and shaded with white along the margins and at the tips; remainder of the under surface of the wings ashy-grey, the primaries shaded with a blackish tinge towards the tips, and the secondaries shaded with white at the tips; tail ashy-black towards the base, the terminal third being white; the inner webs on the under surface mottled with white, and the extreme base white; under tail-coverts white, concealing the ashy-black basal portion; the upper surface of the body and wings ashy-grey; the tips of the primaries blackish, and upper tail-coverts dark ashy-grey; the basal portion of the tail above ashy-black; the secondaries slightly margined at the tips with ashy-white; iris yellowish-brown; cere, lores, and base of the bill lead-colour; culmen greenish-brown; feet yellowish; claws black. Total length 30 inches, wing 23.8, tail 11.7, tarsus 4.1, bill 2.4, culmen 3.0, middle toe 3.0, hind toe 1.6.

Adult male. Is the same in plumage, but slightly smaller in size. Total length 28.5 inches, wing 22.3, tail 10.5, tarsus 4.0, bill 2.0, culmen 2.6, middle toe 2.9, hind toe 1.6.

Progress towards maturity. The throat, abdomen, flanks, and under tail-coverts become white first; the chest retaining its brown markings until about the third year, when a broad central line of white, with a brown or black hair line down the shaft, appears; the white and brown markings of the body above grow out and change to ashy-grey, which increases and becomes darker in tint each year until the basal portion of the tail and the tips of the primaries past the notch become in the adult almost black; the brown on the terminal third of the tail becomes freckled, and lastly white, like the head and neck; in some apparently adult birds there is a hair-line of black or brown down the shaft of many feathers on the chest, head, and neck.

Young. Brown above all the feathers, margined at the tips with lighter brown, shafts dull brown, the nape and hind neck sometimes tinged with tawny, back and rump of a darker dull brown, the feathers tipped with whitish-brown; wings dark-brown, feathers margined at the tips with whitish-brown; shoulders and smaller wing-coverts margined with whitish; primaries dull brown, blackish-brown at the tips, white freckled with dark-brown at the base, especially on the inner webs; secondaries becoming whitish at the base, more extensively on the inner webs, and freckled with brown; head and neck dull brown, sometimes tinged with tawny, streaked with brownish-white down the centre of each feather, shafts blackish; throat buff; under surface rufous-brown, each feather centered with a streak of buff, and tipped with buffy-white; flanks, abdomen, and under tail-coverts buff, freckled with brown; legs brown with a broad shaft stripe of deep buff; axillaries and under wing-coverts buff; base of the primaries and their coverts white, freckled with brown; under surface of shoulders dull brown, margined with deep buff; tail beneath white freckled with dark brown and tipped with white; above white, freckled with brown and becoming darker brown near the ends, which are margined and tipped with white, base white; upper tail-coverts similarly marked to the tail, but of a lighter brown.

Habitat. The coastal districts of Australia and Tasmania, and sometimes being found on the continent, a distance of 300 miles inland; New Guinea, the whole of the Malay Archipelago, and extending to Ceylon and India.

Haliastur indus girrenera, Hartert, *Nov. Zool.*, vol. iii, p. 248 (1896).

Adult male. The whole of the head, neck, chest, and breast snowy white, the tips of the primaries above past the notch black, below black, shaded in certain lights with brown along the shaft, which is white at the base; tips of the tail above white, which extends more over the centre two and adjacent feathers, the outer two on either side with no white, the next to them with only a wash white round the margin of the tips, under surface of the tail, except the afore-mentioned white tipped portions light cinnamon red; the secondaries and base of the primaries rich cinnamon red; the remainder of the upper and under surface bright, rich, deep chestnut (or deep maroon chestnut); cere, legs, and feet yellow; bill light horn colour, bluish lead-colour at the base. Total length, 18·5 inches, wing 15·3, tail 7·7, tarsus 2 inches.

Adult female. Similar to the male, but slightly larger. Total length 21 inches, wing 15·5, tarsus, 2·3, tail 8·6.

Young. Head and neck dull creamy white, washed with brown at the base and along the margins of the feathers, giving to these parts a striped appearance; face brown; throat and chest whitish; breast light rufous-brown, streaked with ashy-white down the centre of each feather; abdomen, thighs, and under tail-coverts dull white, margined with light rufous-brown; primaries blackish-brown, secondaries washed with rufous, becoming white at the tips; tail rufous-brown, tipped with whitish.

Remark. In some specimens the primary coverts above, nearest the margin of the shoulders have a black shaft-stripe and remains of black cross-bars, the latter also are noticeable on the inner webs of some of the inner primaries and inner secondaries, and on the tail feathers. The plumes covering the flanks, and the feathers at the upper joint of the thighs also, are occasionally white, as well as the small feathers at the base of the scapulars; the smaller scapulars have occasionally black shaft-lines and also transverse bars of black on their concealed portions, basal portions white. These facts will assist in bearing out Mr. Sharpe's opinion, with which I entirely coincide, that the Australian bird (*Haliastur girrenera*) cannot be admitted to hold full specific rank, but with *Haliastur intermedius* (Gurney) must be considered a fixed variety of the Indian Fish-Hawk (*Haliastur indus*).

Habitat. Derby (N.W. Austr.), Port Darwin, Port Essington, Gulf of Carpentaria, Cape York, Rockingham Bay, Port Denison, Wide Bay District, Northern Coastal Districts of New South Wales, New Guinea, Celebes, Louisiade Archipelago, Solomon Islands.

Ictinaetus sphenurus, *Gurney, jun., Cat. Bds. Prey*, p. 26 (1894).

Remarks. The following description of what appears to me to be a fully adult but not a very old bird will be found to agree with the stage of plumage in which full-grown birds of this species are usually obtained.

Adult female. General colour dull ashy brown, shaded with fulvous and dark brown; primaries blackish; the whole of the head and neck dull brown tinged with rufous, chiefly down the centre of the feathers, with the shafts black, giving a streaked appearance; sides of the face and throat light brown, the bases of the feathers darker; chest, breast, and abdomen dull fulvous brown, with blotches of dull white or fulvous near the centre of feathers on either side of the shaft, and a stripe of dull white down the tip, which is sometimes washed with fulvous; on those parts nearest the abdomen the stripes are narrower and the blotches larger and more conspicuous; flanks fulvous brown, bases of the feathers white; thighs dull fulvous with a dark brown shaft-stripe and irregular cross-bars; under tail-coverts fulvous crossed with irregular broken bars of dull deep brown; tail below ashy brown, washed with fulvous on the inner webs and freckled with dark brown; tail above dark brown washed with ashy on the outer margins and tips, and freckled with light rufous at the base; inner webs fulvous, shaded at the tips and thickly freckled and crossed with irregular broken bars of dark brown on the body of the feathers; upper tail-coverts, rump, and back, dull brown, the feathers white at the base; margins of the shoulders and the under wing-coverts white at the base, becoming ashy brown crossed with

dark brown bars, and largely tipped with deep fulvous; shaft-stripe black; primaries above black, the outer and the inner webs near the base rich sepia brown. The basal marginal half of the inner two primaries and outer two secondaries light rufous barred with dark brown; remainder of the feathers dark brown, lighter at the tip, outer web sepia brown; secondaries deep sepia brown, with rich metallic lustre, inner webs from near the tips light rufous barred and freckled with dark brown; median and primary coverts similarly coloured; remainder of the upper wing-coverts dark brown, some on the shoulders washed with pale rufous, all margined or tipped with ashy white, fulvous, or light rufous, and having a brownish black shaft-stripe; scapulars deep sepia brown, smaller ones margined and tipped with ashy brown, all washed, freckled or barred with pale rufous, which predominates on the concealed portion of the feathers, where also the brown forms irregular bars; extreme base, white; under surface of the wing quills are ashy brown, all, except the outer primaries which are whitish at the extreme base more or less freckled or barred with light rufous; cere bluish grey; bill dark horn brown, lighter on the sides; feet and legs bluish grey; iris, rich hazel. Total length 22 inches, wing 16.9, tail 10.7, tarsus 2.3, bill 1.5, culmen 1.8, culmen without cere 1.35.*

Adult Male. Similar in plumage to the female, but not so large. Total length 20.5 inches, wing 15.5, tail 10.5, tarsus 2.25, bill 1.3, culmen 1.6, without cere 1.3.

Young. Similar to the above description, but having the wing-coverts and most of the feathers of the upper surface tipped largely with ashy or fulvous white, a well-defined blackish shaft-line on all the feathers, and those of the head and neck washed with rufous; on the back of the neck the feathers are crossed with irregular dark brown bars, the bases of all being white; the under surface is of a lighter dull fulvous brown, blotched and striped with fulvous white.

Nestling. Reg. No. B. 6434. "Taken from the nest December 18th, 1883, Interior of New South Wales. Iris light reddish-brown bill and cere dark horn colour; feet and legs bluish-white, claws dark horn colour." Total length 8 inches; bill from forehead 1 inch, from gape 1.1; tarsus 1 inch; covered with short white down, erect, longer and of a brownish tinge on the hind neck and head.

Habitat. All parts of Australia, New Caledonia, South Coast of New Guinea.

* NOTE.—Not having met with any specimens in such adult plumage as that described and figured by Mr. Gould, whose description has evidently been taken from a very old bird, I transcribe it here verbatim:—"Head, neck, and all the under surface light sandy brown, each feather margined with a darker colour; feathers of the back and wings brown, margined with grayish white; primaries blackish brown; tail greyish brown, rather long and rounded at the end; cere and bill brownish white, gradually becoming darker towards the tip; legs bluish white; irides hazel." (*Gould, Bds. Aust.*, vol. i, pl. 5.)

Specimens from New Caledonia are often of a much lighter colour, especially on the upper portion of the head, neck, and scapulars.

Adult male. All the upper surface blackish brown, the median wing-coverts and margins of the feathers being lighter, the shaft-stripes blackish; primaries and secondaries blackish brown, the first six primaries black at the tips, the remainder and the inner secondaries slightly margined with light brown, indistinct bars of blackish brown showing on the inner webs of all the quills; the inner webs of the outer series of the wing-coverts, of a few of the innermost secondaries, and of the scapulars, becoming white at the base and barred with dark brown; wing-coverts brown barred with blackish brown, base of the feathers white; back, rump, and upper tail-coverts dark brown fading into a little lighter brown on the margins, the bases white, shaft-stripes blackish brown; tail slightly forked, dark brown above indistinctly barred with blackish, the inner webs becoming lighter towards the base, and freckled with dark brown; under surface of the tail ashy brown freckled and barred with darker brown; under tail-coverts rufous brown, with blackish shaft-lines; the head and neck above brown washed with rufous and streaked with blackish shaft-lines; lores and ear-coverts dark brown, the latter tinged with rufous brown; chin whitish; the throat light rufous brown, remainder of the under surface of the body dull rufous brown darker on the chest, sides, and flanks, all the feathers having a blackish shaft-line; under wing-coverts rufous brown striped with blackish down the centre, the outer series, and the bases of the primaries ashy, irregularly shaded or barred with dark brown; quills blackish brown, the inner webs especially, towards the base lighter; bill black; base and cere yellowish; feet and legs yellowish; iris hazel. Total length 19·5 inches, wing 15·8, tail (*to tip of outer feathers*) 10, tarsus 2·1, middle toe (without claw) 1·6, inner toe 0·9, outer 1·15.

Adult female. Similar to the male in size and color.

Young. The young may be distinguished by all the feathers being tipped with rufous, the head and neck rufous margined with brown and striped with blackish shaft-lines; under surface

brown striped with rufous down the centre of the feathers; shaft-lines blackish; throat and sides of the face rufous brown; lores, region of the eye, and upper portion of the ear-coverts blackish.

Habitat. All parts of Australia, New Guinea, Duke of York Island, India.

Milvus pacificus, Strickl. *Orn. Syn.*, p. 135 (1855).

Adult female. The feathers of head and nape elongated into an occipital crest; forehead whitish buff; sides of the face, chin, and ear-coverts greyish white, the terminal portion of each feather

and the shaft-line black; those on the crown of the head, nape, and hind neck rich light rufous, broadly centered with blackish-brown, the basal portions of all the feathers being white; throat buffy white, a broad stripe of dark ashy brown margined with rufous, down the centre of each feather; sides of the neck, hind neck, and all the under surface rich rufous, being lighter on the flanks, each feather having a black shaft-line, and a broad stripe of black down the centre, washed with ashy on the sides of the neck and chest, and narrowing into a shaft-line of black on the lower portion of the breast and flanks; abdomen rich rufous; the breast, centre of abdomen, and flanks, mesially shaded or faintly barred with ashy brown on the concealed portions of the feathers; thighs, lower part of abdomen, and under tail-coverts rich rufous, paler in tint on the latter, with shaft-lines of a deeper rufous tint; the extreme base of all the feathers on the under surface snow-white; under surface of the tail ashy-brown, becoming ashy-white towards the base, indistinctly barred near the end with blackish brown; tail above dark brown, washed with ashy on the outer webs; margins of the inner webs fading into ashy-white, freckled with brown at the base, crossed with a few indistinct bars of brown which are wider and become blackish brown at the tips; tips narrowly margined with white; upper tail-coverts and rump dark brown, back and interscapular region darker brown; primaries brown, washed with ashy; the tips darker, base white, and the basal marginal two-thirds of the inner webs as far as the notch white; secondaries dark ashy brown, becoming white freckled with brown at the base of the inner webs; all the feathers banded with blackish brown, the last band broader and darker on the tips of primaries and secondaries, where they form a sub-terminal blotch; median and greater wing-coverts dull brown, mesially shaded with darker brown, and washed with fulvous brown on the margins; remainder of the wing-coverts above brown, shaded with blackish brown at the tips, bases snow white; under surface of the primaries ashy brown, with blackish brown bars, basal portion of the inner margin white; secondaries ashy brown, becoming white at the base, bars on all the quills showing through; under coverts of primaries and secondaries ashy white, shaded and barred with ashy-brown, darkest at the tips, where some are washed with pale rufous; remainder of the under coverts and the axillaries rich rufous, mesially shaded towards the base with ashy brown, shafts blackish; small marginal feathers of the wing light rufous, edged with buff at the tips; cere and base of the bill flesh white, blackish at the tip; legs and feet greyish flesh colour, iris yellow. Total length 22 inches; wing 19.9; tail slightly forked, central feathers 10.3, outer 10.9; tarsus 2.0, bill 1.9, culmen without cere 1.1; from the angle of the mouth to the base of anterior margin of nostril 0.95, from thence to tip of bill 0.95.

Those specimens I have examined show very little variation in colouring; the flanks are in some a little paler, and occasionally washed with ashy brown, and the median wing-coverts in some incline to fulvous or pale rufous on their margins; wings very long, extending beyond the tip of the tail.

Young. Not so bright in the rufous colouring of the chest and abdomen; the blackish markings on the tips of the feathers duller brown, flanks lighter, tail more distinctly barred, no ashy grey on cheeks and sides of the neck.

Habitat. Wide Bay District, Dawson River, Richmond and Clarence Rivers District, New South Wales, Interior, Victoria, South and West Australia.

Measurements of average-sized specimens from different localities.

Gypoictinia leucosternon, *Kaup, Arch. f. Naturg.*, 1850, p. 33.

Male. "Above blackish, browner on the scapulars, lower back, and rump, the latter part washed with rufous, some of the feathers lighter-edged; smaller wing-coverts ashy grey, each feather blackish in the centre, the rest of the wing-coverts black, the inner ones washed with rufous; quills black, the secondaries ashy grey towards their tips; primaries externally ashy white at base, the outer ones shaded with grey; primaries underneath white at base, black towards the tip, the secondaries greyish below; upper tail-coverts black, outer ones washed with rufous; tail ashy grey above, paler below, and inclining to white near the base; head crested, the fore part of the crown black, the hinder part and the nape, as well as the sides of the neck, tawny rufous, some of the feathers black in the centre, producing a striped appearance; cheeks, ear-coverts, and entire under surface, black, some of the flanks and abdominal feathers inclining to ashy; thighs and under tail-coverts rufous, with black shaft-lines; under wing-coverts blackish, the small ones varied with white, and some washed with rufous. Total length 24 inches, culmen 2.45, wing 19, tail 8.5, tarsus 2.65, middle toe 1.95."*

Adult female. Total length 22.5 inches; wing 19; tail 8.5; tarsus 2.55; bill from forehead 2.1, from gape 2.1, from nostril 1.35, culmen 2.2. "Iris hazel; bill pale horn colour; cere ashy brown; feet and legs greyish; claws black. Sex female, shot from nest."

Adult female. Total length 23.5 inches; wing 18.6; tail 8.7; tarsus 2.5; bill from forehead 1.85, from nostril 1.18, from gape 2.27; culmen 2.2.

Nestling. Covered with white fluffy down. Cere bluish, bill dark horn colour, feet ashy-white, bare space on the face bluish-lead colour. Total length about 11 inches. Dark rufous-brown feathers first appear on the nape, interscapular region, upper wing-coverts and tail; the quills blackish with reddish-brown margins.

Remarks. In addition to Mr. Sharpe's very good description of this bird, in specimens usually examined the feathers of the nape, hinder part and sides of the neck are rich rufous with a black shaft stripe; mantle, interscapular region, and the outer

* Sharpe, *Cat. Bds. Brit. Mus.* vol. i, p. 335 (1874).

webs of the wing-coverts jet black, inner webs of the wing-coverts rufous, under primary coverts dark slate colour, thighs and under tail-coverts rich rufous with a blackish shaft stripe, the notch in the first four primaries are largely developed. When the wings are extended the large white patch at the base of the quills is very conspicuous and the bird can thus easily be recognised at a great height.

Habitat. Derby (N.W. Austr.), New South Wales, Interior, South Australia, West Australia.

Adult female. Forehead white, becoming bluish-grey on the crown of the head; all the upper surface light silvery bluish-grey, becoming almost white on the outer webs of the tail-feathers, pure white on the inner webs and on the under surface; the whole of the under surface of the body snow-white, with a faint shade of silvery grey on the flanks and sides of the chest; wing-coverts (shoulders), except the largest series, black; wing bluish silvery grey, darker on the primaries, which are darkest at the tips; under surface of primaries dark bluish-grey, inclining to blackish on the outer quills; inner series of the primary coverts black, remainder dark bluish-grey, shaded with blackish on margins, small feathers under spurious wing, at base of upper primary coverts black; margins of the wing and rest of the under wing-coverts and axillaries snow-white; under surface of the secondaries and scapulars white, with a faint shade of bluish grey; lores, and a narrow line over the eye black; bill and claws black; cere citron; legs and feet yellow; iris varying from deep carmine to blood red. Total length 13·4 inches, expanse of wings 37·7, wing from flexure 12, tail 6, tarsus 1·5, tibia 2·8, mid-toe 1·2, outer toe 0·75, inner toe 0·8, hind toe 0·75, bill from posterior base of cere 0·9, culmen 1·1, bill from nostril 0·6, from anterior margin of cere 0·8, from angle of the mouth to tip of bill 1·3, shield over the eyelid 0·45 × 0·2

Adult male. Similar to the female in plumage, and equal in size.

Young. Resembling the adult, but having the crown of the head and all the upper surface of the body brown, washed with pale rufous on the sides of the neck, scapulars and adjacent wing-coverts, rump, and upper tail-coverts; the chest washed with pale rufous at the tips of the feathers, which are centered with a narrow shaft stripe of dark brown; shafts of the wings above dark brown, those of the tail feathers almost black; of both the wings and tail below white, except those of the primaries, which are brown; the two centre tail feathers and outer webs of the rest ashy brown, tips and remainder of the tail feathers white; wings ashy brown, darker towards the tips of the primaries; secondaries and greater wing-coverts largely tipped with white, those parts of the wing above black in the adult are

of a blackish brown, many of the feathers margined with white; under surface of the primaries and the larger series of their coverts ashy brown, becoming white freckled with brown on the margins of the inner webs; a small blackish brown patch at the base of primaries; margins of the shoulders white.

Habitat.—Gulf of Carpentaria, Cape York, Rockingham Bay, Port Denison, Wide Bay District, Richmond and Clarence Rivers Districts, New South Wales, Interior, Victoria, South and West Australia.

Austr.*, p. 107 (1896); *id.*, *Vict. Nat.*, vol. xiii, p. 61 (1896).

Adult female. Above delicate ashy white, forehead, sides of the face, margins of the shoulders and of the wings, and the whole of the under surface, pure white, spot on the lores and narrow ring round the eye black; shoulders above and all the upper wing-coverts, except the largest series, black; small feathers at the base of the primaries concealed by the spurious

wing, black; greater wing-coverts ashy grey, secondaries light ashy grey fading into white at the tips and inner margins, primaries and primary-coverts ashy grey washed with ashy brown, becoming white on the margins of the inner webs, their shafts brown; scapulars light ashy brown above, white beneath; centre two tail feathers and outer webs of next two on either side ashy white, remainder of the tail feathers above, the shafts, and all below pure white; axillaries and all the under wing-coverts except the larger series black (which following the line of the wing-bones forms a black-shaped mark); the larger series of the wing-coverts and those at the base of the primaries ashy grey, under margin of the wing white. Cere and feet yellow; bill black; iris orange red. Total length 14.5 inches, wing 12.2, tarsus 1.6, tail 7, bill 1, culmen 1.1.

Adult male. In plumage the same as the female, in size slightly smaller. Total length 13.5 inches, wing 11.4, tarsus 1.4, tail 6.5, bill 0.95, culmen 1.

Young. Above ashy brown, the tips of all the feathers more or less margined with white, except those on back of the neck and interscapular region. Those parts of the wing black in the adult are of a blackish brown, margined with white near the primaries and on the shoulders. This specimen is of the same size as the adult male.

Habitat. Wide Bay District, Richmond and Clarence Rivers Districts, New South Wales, Interior, Victoria, South and West Australia.

Soc., Queensld.*, vol. v, p. 15 (1889); Sharpe, *Index, Gould's Works*, p. 30 (1893); Gurney, *jun.*, *Cat. Bds. Prey*, p. 27 (1894).

Avicida subcristata, Lafr. *Rev. Zool.*, 1846, p. 127; Bonap. *Consp. Av.* tom. i, p. 20 (1850); *id.* *Rev. et Mag. de Zool.*, 1854, p. 535.

Pernis subcristatus, Kaup, *Isis*, 1847, p. 343; *id.* *Contr. Orn.*, 1850, p. 77.

Adult. Head and neck ashy grey, darker on the crown and towards the occipital crest, which is almost black; scapulars, inner secondaries, and their coverts, and the remainder of the upper surface of the body brown; the wing-coverts interscapular region, tips of the outer scapulars, blackish slate; primaries and secondaries above very dark brown, becoming blackish on the outer webs, the base of their inner webs and their under surface light ashy grey (white in certain lights), narrowly margined with white at the base; all the quills broadly barred with black, the last bar the broadest, and forming a subterminal spot at the tip, which on the inner primaries and the secondaries is sometimes narrowly margined with white; bars on the basal portion of the under surface obsolete—or confined to the outer webs: tail ashy brown above, light ashy grey below, the basal half crossed with three interrupted black bands formed by a series of spots which are confined to the central part of the feathers, and not extending to the margins; the terminal half of the feather is crossed at the tip with a broad black band, which on the outer two feathers forms a subterminal blotch, the tips of these feathers more or less margined, and the outer ones broadly tipped with ashy white on the under surface, the shafts blackish above, white below; sides

of the face, lores, throat, and chest ashy grey of a lighter tint than the neck; the breast, upper portion of the abdomen, and thighs, and the flanks, buffy white, washed towards the tips, with rufous and broadly barred with chestnut brown on the exposed portions, and dark ashy brown on the concealed portions of the feathers (*the chestnut brown bars consisting of a broad bar of dark ashy brown, centred and margined with a narrow bar of rufous chestnut*); the abdomen, lower half of the tibia, under tail and wing coverts rich rufous buff, the outer series of the under primary-coverts buff. Bill black, iris bright yellow, cere and legs greyish yellow. Total length 16·6 inches, wing 13·6, tail 8·5, tarsus 1·5, bill from forehead 1·1, from cere 0·75, culmen 1·2.

Adult female. Similar to the male in plumage and size, or perhaps a trifle larger.

Immature birds are of a lighter brown above than in the fully adult, occipital crest dark brown; throat buffy white; chest, sides of the neck, and dorsal feathers ashy grey, washed with pale rufous; the breast and the remainder of the under surface buffy white, the bars narrower, and of a chestnut brown tint; abdomen, under tail and wing coverts buff; all the bars on the tail extend across the feathers, the bars near the base being dark brown, that at the tip broadest and blackish brown; the inner webs at the base are lighter and frequently freckled, and marked with spots of blackish brown, margined with white.

Young. "Above paler brown than in the adult, with narrow margins of ochraceous buff to the dorsal feathers and wing-coverts, becoming broader and more white on the inner secondaries; crown dark brown, as also the occipital crest, the white bases to the feathers rather conspicuous; forehead and sides of the face dusky cinerous, the former inclining to whitish; throat whitish; fore neck and chest buff, with a rufous tinge, which extends on to the sides and hinder part of the neck; breast buffy white, barred with rufous brown, much more narrowly than in the old bird; thighs and under wing and tail coverts rich buff, the former crossed near the base with a few narrow bars of rufous brown."*

Habitat. Port Darwin, Port Essington, Rockingham Bay, Port Denison, Wide Bay District, Dawson River, Richmond and Clarence Rivers Districts, New South Wales.

Falco communis, part, *Schleg. Mus. Pays-Bas*, *Falcones*, p. 3 (1863); *id. Vög. Ned. Ind.*, p. 22, pl. i, fig. 2 (1866).

Adult male. The whole of the head, the nape, and the back of the neck, sides of the face, ear-coverts, and cheeks, extending to the sides of the throat, black; throat pale buff, almost white; chest creamy buff, deepening in tint towards the breast, where the feathers have a pale rufous shaft-stripe, and frequently a spot of black near the tip; the rest of the under surface buffy white, closely barred with narrow cross lines of black; the flanks, sides of the body, and thighs washed with bluish grey; the breast and central portion of the abdomen washed with pale rufous fawn, shaft-lines rufous fawn on the interspaces; axillaries and under wing-coverts light buff, barred with brownish black, and washed with bluish grey; the greater series and the under surface of the primaries, dark ashy-brown, barred with buffy white; interscapular region black, having a few transverse obsolete bars of bluish ashy grey; the remainder of the upper surface bluish ashy grey barred with black and having a black shaft-stripe, which joining the bars, gives them a somewhat triangular form on the rump and upper tail-coverts; the bands on the tail broad, eleven or twelve in number, and increasing in size towards the tip where, being broadest, they take a triangular form; the tips of all the tail-feathers creamy white; the secondaries and inner primaries above narrowly margined with creamy white at the tips, the interspaces on the inner webs, towards the base, washed with buff; the primaries at the tips and on the outer webs black, on the inner brownish at the base, barred with rufous buff, the bars obsolete towards the tip, where they are washed with bluish grey nearest the shaft, and confined to the middle portion of the web; bill bluish green at the base, blackish horn-colour at the tip, lower mandible greenish yellow, bluish horn-colour at the tip; cere greenish grey; iris hazel; legs and feet greyish yellow; claws dark horn-colour. Total length 16·5 inches, wing 12·7, tail 6·7, tarsus 2·0, bill from gape 2·3, from forehead 1·1, culmen 1·2.

Adult female. Similar in plumage to the male, but larger and more highly coloured; the under surface is washed with deep rufous fawn, being pale rufous on the chest and buff on the throat; the

bars on the under surface are narrower, wider apart, and sometimes irregular. Total length 17 inches, wing 13·3, tail 7·5, tarsus 2·05; bill from forehead 1·1, from gape 1·35, culmen, 1·25.

Young. The young of both sexes somewhat resemble the adults. The under surface is of a more fawn-coloured or ferruginous hue from the chest downwards; the chest is streaked with dart-shaped markings, and the breast and abdomen with longitudinal markings of blackish brown; the flanks and thighs barred with bracket-shaped, and the legs with hastate markings of the same colour; the axillaries and under wing-coverts are centered and barred with blackish brown; the upper surface is tinged with brown, the quills margined at the tips with buffy white; all the feathers of the body above margined with fulvous, more broadly on the wing-coverts, secondaries, and upper tail-coverts.

Habitat. Derby (N. W. Austr.), Port Denison, Wide Bay District, Richmond and Clarence Rivers Districts, New South Wales, Victoria, South and West Australia, Tasmania.

Gennaia hypoleuca, *Gurney, Ibis*, 1882, p. 452; *id. List Diurn. Bds. Prey*, p. 111 (1884); *Gurney, jun., Cat. Bds. Prey*, p. 29 (1894).

Hierofalco hypoleucus, *Bonap. Rev. et Mag. de Zool.*, 1854, p. 536.

Adult female. All the upper surface bluish ashy grey, all the under surface of a lighter ashy grey tint, each feather having a blackish shaft-line down the centre, more conspicuous on the upper than on the under surface. Wings above have a more ashy tint on the margins of the coverts and secondaries; all the wing-feathers, scapulars, rump, upper and under tail-coverts and tail crossed with ashy brown bars, darkest and more distinct on the tail and wings; tips of the tail-feathers margined with ashy white, the bars of the under surface of the tail of a browner tint; primaries above blackish brown; shafts lead-colour; the outer webs of the basal portion washed with bluish ashy grey, inner webs ashy white, freckled with brown and crossed with triangular denticulations of a darker tint, running from the shaft and reaching nearly to the margin; secondaries ashy grey; the margins of the inner webs ashy white freckled with brown and barred like the primaries; the inner primaries and secondaries narrowly margined with white at the tips; under surface of the wings and axillaries ashy white, with indistinct shaft-lines; the throat and abdomen and under tail-coverts are paler than the rest of the under surface of the body, and in some specimens almost white; the frontal line and sides of the face light ashy grey; ear-coverts whitish, tinged with ashy grey on the upper portions; a narrow line of black round the anterior portion of the eye, widening below it, formed by produced black shafts of feathers about the lores; iris hazel; orbits, legs and feet bright deep yellow; bill yellowish at the base, dark horn-colour at the tip. Total length 15 inches, wings 12·6, tarsus 1·8, tail 6·5, bill from forehead 0·9, from gape 1·1, culmen 1·1.

Adult male similar in plumage, but slightly smaller. Total length 12 inches, wing 11·1, tail 6·2, tarsus 1·75, bill 0·85, from gape 1·1.

Habitat.—Gulf of Carpentaria, Wide Bay District, Dawson River, New South Wales, Interior, South and West Australia.

Gennaia subniger, Gurney, *List Diurn. Bds.*, p. 111 (1884); Gurney, *jun.*, *Cat. Bds. Prey*, p. 29 (1894).

Adult female. The whole of the upper and under surface dark brown, becoming blackish brown on the upper surface and dull

slaty brown on the under surface of the primaries and secondaries; margins at the tips of the scapulars, inner primaries, and secondaries buffy white; inner webs of the primaries barred on the central portion and much freckled at the base with very pale rufous, the secondaries with a few spots of same tint near the base; the under-tail and primary-coverts spotted on either side of the shaft with oblong marks of buffy white; tail crossed with indistinct broken bars of very pale rufous, and tipped with buffy white; on the chest and breast, and on some of the axillaries are a few scattered spots of pale rufous; the feathers of the throat, cheeks, and ear-coverts white, tipped with brown, giving them a mottled appearance; a narrow line over the eye, and from the lores a broad oblique short blackish stripe descends to below the ear-coverts on the side of the throat; bill lead-blue at the base, blackish at the tip and along the culmen; cere yellow; legs and feet yellowish; claws black. Total length 20·5 inches, wing 15·7, tail 10, tarsus 2·2, bill from gape 1·4, from forehead 1·1, from nostril 0·8, culmen 1·2.

Adult male. Similar in plumage, but smaller than the females. Some specimens have no spots or bars on the under tail-coverts and tail, and the chin alone white. Total length 18 inches, wing 14·3, tail 8·6, tarsus 1·9, bill from forehead 1, culmen 1·1, from gape 1·2.

Habitat.—Rockingham Bay, Wide Bay District, Dawson River, New South Wales, Interior, Victoria, South Australia.

Adult male. All the upper surface slaty-blue, being darkest on the shoulders and interscapular region; lightest and inclining to lead-colour on the back, rump, and upper tail-coverts, and of a dark brownish tinge on the head; lores and forehead white, or

of a buffy hue; nape and adjacent feathers on the sides of the neck tinged with rusty; sides of the neck, throat, and lower part of the ear-coverts white, occasionally tinged with rufous buff; cheeks, sides of the face, and upper parts of the ear-coverts, brownish black; chest, buffy-white washed with light rufous, becoming light rusty rufous on the remainder of the under-surface, deepest on the flanks, where faint greyish cross-bars appear; breast striped with shaft-lines of greyish brown; under surface of the wings dull rufous, lighter on the margins of the shoulders, and crossed with ashy brown bars; the outer series of the under wing-coverts and the axillaries ashy brown, tipped and spotted on both webs with pale rufous; primaries dark brown washed with slaty blue on the outer web, and barred with a series of transverse oblong spots of pale rufous on the central portion of the inner webs; secondaries slaty blue, barred like the primaries with light rufous; upper wing-coverts and scapulars slaty blue, with a few oblong spots of light rufous near the base of the feathers—many of the wing-coverts, scapulars, and quills showing indistinct dark cross-bars; the tips of the secondaries and some of the inner primaries margined with white; the rump and upper tail-coverts light slaty blue, with indistinct cross-bars; shaft-stripes dark brown; the two centre tail-feathers and the outer webs of all the rest, slaty blue barred with blackish brown, the inner webs barred alternately with blackish brown and rufous, the last brown bar the deepest in tint and forming a broad subterminal blackish band; the tips of all the feathers rufous; lower part of the abdomen, and under tail-coverts, buff, shaded with rufous and having obsolete bars of ashy brown; orbits, cere, and base of the under mandible yellowish; bill bluish lead-colour; tip black; feet yellow; iris dark brown. Total length 11·2 inches, wing 9·7, tail 5·5, tarsus 1·35, bill 0·75, culmen 0·8.

Remark. The first primary is frequently margined on the outer web with a narrow wavy line of pale rufous; the forehead and lores, even in fully adult birds, and the nape and sides of the neck, tinged with deep rusty rufous.

Adult female. Similar in markings, but not so brightly tinted as the male, and considerably larger. Total length 13·8 inches, wing 11·4, tail 6·1, tarsus 1·45, bill 0·8, culmen 0·9.

Young. "Above slaty blue, with broad rust-coloured margins to the feathers, the secondaries plainly tipped with buffy white; the crown and upper tail-coverts rusty, being quite obscured by the margins to the feathers; forehead whitish; fore part of cheeks, region of the eye, and ear-coverts brownish black; hinder part of cheeks, sides of neck and throat creamy white; chest creamy buff, tinged with rufous, with several dark brown streaks

down the centre of the feathers; remainder of the under surface deep rufous; the lower abdomen, vent, and under tail-coverts tawny buff, with a few rufous shaft-stripes and bars; under wing-coverts dull rufous, with oval spots of creamy buff; primaries dark brown, tipped with whitish and barred on the inner web with rufous; tail greyish above, browner beneath, all the feathers barred across and tipped with rufous.”*

Remarks. Not having a young specimen from N. S. W., the above description has been taken from the British Museum Catalogue. The following descriptions, however, are from a fine series in the Australian Museum of the young, and adult female, from King George's Sound; but although differing in some respects from the New South Wales birds, they can scarcely lay claim to be considered a distinct species.

Specimen No. 1 juv. K.G.S.—Above slaty blue tinged with brown, tail dark brown tinged with ashy, the inner webs and the under surface dark brown, the central portion of the inner webs barred, and that of the outer spotted with rufous, the spots being obsolete on the two central and on the outer web of two external feathers, a few of the upper tail-coverts also spotted near the base with rufous; all the feathers of upper surface broadly tipped with rufous; feathers of the head and neck rufous, with a blackish brown shaft-line and base, giving a streaked appearance; forehead buff tinged with rufous; throat buff; sides of the neck and lower part of the ear-coverts buff washed with rusty rufous, deepest in tint behind the ear-coverts; lores, forepart of the cheeks, sides of the head, and ear-coverts brownish black; chest buff, rufescent on the breast, and becoming rufous on the remainder of the under surface, being lighter on the lower part of the abdomen and under tail-coverts, and deepest on the central portions, sides, and flanks; all the feathers centered with a shaft-line of brownish black, which widens into narrow stripes on the chest; the flanks crossed with ashy brown bars triangular in form, the axillaries and outer series of the under wing-coverts dark brown with oval spots of pale rufous; the remainder of the under wing-coverts brown, washed with rufous, and tipped and spotted with a lighter tint; primaries above blackish brown; secondaries washed with ashy; all the quills barred on the central portion of their inner webs with light rufous, and with the primary coverts having the tips margined with buff narrowly edged with white; bill bluish horn-colour; culmen darker, lower mandible whitish, at the tip horn-colour; legs and feet flesh grey. Total length 12·3 inches, wing 9·7, tail 5·3, tarsus 1·55, bill 0·63, culmen 0·73.

* Sharpe, Cat. Bds. Brit. Mus., vol. i, p. 399 (1874).

Spm. No. 2 juv. Is similar in plumage, the stripes on the breast may be a trifle broader, the under surface is of the same deep rufous tint; and the flanks a little more distinctly barred, the rufous spots and bars on the tail are closer together but not continuous.

Spm. No. 3. This bird had apparently only just arrived in adult plumage, but the whole of the colouring is much brighter than in any other specimens I have examined. The whole of the upper surface is of a fine rich slate-blue, head and wings rich blackish brown; tail blackish brown washed with slaty blue on two central feathers, and outer webs of remainder tipped, and barred in most instances quite across the feather, with rufous the two central feathers barred with slaty black, the interspaces near the base tinged with rufous; the cheeks, ear-coverts, and region of the eye, brownish black; forehead buff tinged with rufous; a few tawny feathers on the sides of the neck; throat white, lower parts tinged with rufous buff, all the feathers with blackish shaft-lines. All the under surface light rusty rufous deepening into rufous on the breast, sides, flanks, and thighs; down the breast are broad streaks of blackish brown, which alter into narrow-shaped markings having a slaty-blue tinge on the side, and irregular broad cross bands of the same tint on the flanks; on the abdomen and remainder of under surface the shaft-stripes are very narrow, but slightly swollen near the tips of the feathers on the legs; on the thighs they are occasionally hastate or arrow-shaped; the primaries and secondaries narrowly margined with white at the tips; bill bluish horn-colour, blackish at the tip; lower mandible lighter at the base; cere bluish grey; feet flesh grey; claws black.

Habitat. All parts of Australia, Tasmania, Flores, Ternate.

Measurements of average-sized specimens from different localities.

Pap. et Mollucc.*, p. 15 (1889); *Gurney, jun., Cat. Bds. Prey*, p. 27 (1894); *North and Kearth., Arct. Horn Exped. Centr. Austr.*, p. 56 (1896); *Kearth., Vict. Nat.*, vol. xiii, p. 62 (1896); *Sclater, List Vert. Anim. Zool. Gard.*, 9th ed., p. 398 (1896).

Adult male. "Upper surface sandy brown, strongly inclining to rufous, with which colour most of the feathers are edged, excepting the scapulars and inner secondaries, where the margins incline to fulvous; the feathers of the lower back, rump, and upper tail-coverts broadly tipped with rufous; head a little lighter than the back, with blackish shaft-stripes; forehead, lores, and an indistinct eyebrow, whitish; nape scarcely at all mixed with white; sides of the face creamy white, the sides of the neck slightly washed with rufous and narrowly streaked with brown; a narrow supraorbital line of feathers, as well as a moustachial streak, from the fore part of eye down the cheeks and the hinder part of ear-coverts, dark brown; under surface of the body creamy white, with brownish shaft-stripes; thighs, axillaries, and inner under wing-coverts chestnut; outer wing-coverts

* Sharpe, *Cat. Bds. Brit. Mus.*, vol. i, p. 421 (1874). Mr. Sharpe remarks: "That the possession by the British Museum of the original types of *Hieracidea berigora*, which were received from the Linnean Society, enables him to prove that the *H. occidentalis* of Gould is the true *H. berigora*."

white; quills dark brown, with a slight tinge of ashy grey, the secondaries paler brown, with rufous white tips, inner surface of wing white, the inner webs barred with rufous above, each bar being almost continuous with the preceding one on the primaries; tail brown, tipped with white and shaded with ashy, barred with rufous, the bars not being continued entirely across the feather; cere pale yellow; orbits bluish flesh-colour; bill bluish lead-colour, black at tip; feet light ashy grey, tarsal scales in front yellowish white; iris brown. Total length 15·5 inches, culmen 1·15, wing 13, tail 7·8, tarsus 2·55."

Adult female. Similar to the male, but a little larger. Total length 17 inches, culmen 1·1, wing 14, tail 8·8, tarsus 2·8.

Young. "Similar to the adults, but plainly spotted and banded with rufous above, especially on the wing-coverts and inner secondaries; under surface of body for the most part pale sandy rufous, mottled with creamy white, where the plumage shows signs of approaching adolescence; thighs deep chestnut brown, with faint cross bars of rufous; the facial features more pronounced than in the adult."*

Remark. The *type specimens* of this species being now in the British Museum, the above descriptions have been doubtless taken from them, and on that account they have been transcribed here.

Habitat. Derby (N. W. Austr.), Interior, New South Wales, Victoria, South and West Australia, South-eastern New Guinea.

Adult male. "Above brown, the feathers very slightly inclining to rufous on their edges, these margins being a little more distinct on the inner secondaries; crown slightly paler brown, with indistinct blackish shaft-stripes, the nape mixed with white; forehead and a distinct eyebrow, as well as of the sides of the face and of the neck, creamy or buffy white; a narrow streak above the supraorbital ridge, as well as a scant stripe from the fore part of the eye across the cheek, and another running under the eye along the upper margin of the ear-coverts, blackish brown, collecting a little behind the latter; quills dark brown, the primaries and outer secondaries tipped with whitish; spotted on the outer web and barred on the inner one with rufous, the inner face of the quills whitish, owing to all but the terminal bars being joined together; tail brown, with an ashy gloss on the upper surface, slightly tipped with white, barred with rufous on the two centre feathers, but not right across the feather, the others barred on the inner and spotted with rufous on the outer web, the latter marks gradually becoming less on the outer feathers; under surface of body creamy buff, the sides of the body and outer face of thighs brown, converging towards the centre of the lower breast, some of the feathers edged with

fulvous; under wing-coverts rich creamy buff, the lower ones and axillaries marked with brown; cere and orbits pale bluish lead-colour; feet very light lead-colour; iris very dark brown. Total length 15·3 inches, culmen 1·1, wing 13, tail 8, tarsus 2·5."

Adult female. Similar to the male. Total length 19·5 inches, wing 15·7, tail 9, tarsus 2·1, bill from base of cere 1·1, from centre of nostril 0·9, culmen 1·3.

Young. "Warmer and more chocolate brown than the adult, from which they are at once distinguished by the brown on the under parts, which in the nestling covers the whole of the breast, and as the bird advances in age gradually disappears, leaving the chest striped with brown, and the flanks much spotted with fulvous; throat and sides of the face ochraceous buff; forehead very indistinctly indicated, the moustache and feathers below the eye and behind the ear-coverts deep chocolate, and broader than in the adult's; feathers of the upper surface edged with rufous, and spotted and half-barred with the same colour, the bars on the tail a little narrower and more rufous than the adult's."*

I have before me a pair of young birds which differ so considerably from what have previously been described as the young of the species that I shall here describe them in full:—

Young. All the upper surface dull dark brown, all the feathers conspicuously margined at the tips with rufous, being deepest in tint on the rump and upper tail-coverts; feathers on the head centered with a blackish shaft-stripe; forehead and line over the eye buff; round the back of the neck from the ear-coverts a well-defined broad collar of buffy white; immediately behind the eye and extending over the upper portion of the ear-coverts a patch of white pencilled with blackish shaft-lines; hind portion of the ear-coverts blackish brown, with rufous margins, lower portion of the ear-coverts, throat, sides of the neck, and chest, rich buff; a narrow black moustarchial stripe extending from the lores on either side of the throat to opposite the ear-coverts; all the under surface rich buff, lighter on the abdomen and under tail-coverts; the sides, flanks, outer portion of the thighs blackish brown, margined with rufous-buff; a few of the feathers on the breast and chest having a brown shaft-line widening into a triangular mark at the tips; under surface of the tail brown, margined at tips with buff, and barred with light

* I have here given Mr. Sharpe's descriptions, as they have in all probability been taken from the type specimens, or from others carefully compared with the types of this species, for although I have examined a large series of both adults and young of both sexes from various parts of Australia, widely separated, I cannot find any which coincide either with Mr. Gould's description of the adults, or with that given by Mr. Sharpe in the British Museum Catalogue, neither of these agreeing with such birds as, until further proof to the contrary, I must consider to be the adults.

rufous, upper surface dark brown, slightly shaded with ashy; the two central feathers barred but not quite across, the outer webs of the others spotted near the shaft and the inner webs barred right across with rich rufous, all margined at the tips with pale rufous; under wing-coverts and axillaries rich buff, many of the feathers blotched at the tips with irregular markings of dark brown; under surface of the wings light rufous buff, the ends of the quills of a darker tint, all the feathers margined at the tips with rufous edged with white, the outer webs spotted, the inner ones crossed with broad bands of rufous which run together on the margins towards the base; scapulars similarly tipped, spotted, and barred with the same tint. Bill light horn colour, bluish round the base, brownish along the culmen, lower mandible faded to straw colour, orbits and cere grey; feet and legs bluish grey; claws brownish.*

These specimens are very similar in size and markings, the male being 16 inches, the female 17 inches in length. The former is from the Ouse River, Tasmania, the latter from "Dabee," New South Wales.

Nestling, Reg. No. B. 6433. "Taken from the nest, October 9th, 1884, about three weeks old, Mossgiel, N.S. Wales. Iris dark brown; bill and cere lead colour, dark at the tip; legs and feet bluish-white, claws dark brown." Total length 9 inches; wing 4; bill from forehead 1, from gape 1; tarsus 1.8; mid. toe (s.u.) 1.15. Covered with dull whitish-brown down above and below, under surface dull white, down on the flanks long and of an ashy tinge; pin-feathers of the wing as far as exposed, and of the tail blackish with rufous margins tipped with down.

Nestling, Reg. No. B. 10155. "Taken from the nest, Mossgiel, October 29th, about a month old. Iris rich dark brown; cere greyish, eyelids bluish-white; bill horn colour; legs fleshy-white; feet whitish, tinged with blue, claws dark horn colour." Total length 11.35 inches; wings 6.1; tail 2.7; bill from forehead 1, from gape 1.2; tarsus 2.4; mid. toe (s.u.) 1.5. Dark brown pin-feathers tinged with rufous-fawn colour upon the sides of the breast; a broken row on the chest, hind neck, interscapular region and back dark brown tipped with light rufous; quills and wing-coverts where visible, black, strongly margined with rufous-fawn, some of the secondaries showing rufous-fawn coloured spots or broken bars, pin-feathers of the upper tail-coverts and tail blackish, broadly margined with deep fawn; all but the centre pair with a spot or band of rufous-fawn.

* A still younger bird, from the Macleay Collection, and kindly lent me for examination, has remains of white down on the head, and the light coloured portions of the under surface are of a rich creamy buff, facial features strongly pronounced.

Nestling, Reg. No. A. 9316. "Taken from the nest, November 13th, 1880, Lachlan River, N.S. Wales. Female. Iris dark brown; bill and cere whitish; legs and feet pale lead blue, claws black; orbits pale bluish." Similar in plumage but slightly more advanced than the preceding, feathers on the sides of the chest blackish; thighs and abdomen brown margined with fawn colour; under tail-coverts fawn colour. Wing 6·3 inches; tarsus 2·4; mid. toe (s.u.) 1·5 inch.

Nestling, Reg. No. B. 10156. "Taken from the nest, October 29th, 1883, Mossgiel, N.S.W. Female? Iris rich dark brown, cere lead colour; bill light horn colour; eyelids white; legs white; feet white tinged with bluish lead colour, claws dark horn colour; between three and four weeks old." Similar in plumage to the preceding. Total length 10 inches; wing 5·5; tail 2·7; bill 1·1, from gape 1·2, from nostril 0·7; tarsus 2·1; mid. toe (s.u.) 1·6 inch.

Habitat. All parts of Australia, Tasmania, South-eastern New Guinea.

Cerchneis cenchroides, Sharpe, *Cat. Bds. Brit. Mus.*, vol. i, p. 431 (1874); *id.* *Rep. Voy. Alert*, p. 13 (1884).

Adult male. All the upper surface of the body light rufous; the scapulars, a few of the inner secondaries and outer series of the wing-coverts having a triangular spot of black near the tip; head bluish-grey, washed with rufous on the margins of the feathers, the shafts black, which also appears on the nape, and on the sides and back of the neck; primaries and secondaries blackish brown, the marginal half of the inner webs (except at the tips) toothed with white, more widely towards the base, the apex of the teeth-like markings margined with pale rufous which forms a wavy line along the centre of the web; inner primaries and secondaries margined at the tips with buffy white; primary coverts, spurious wings, and a few of the innermost secondaries irregularly blotched or mottled with rufous; interscapular region and back clear rufous without spots; lower part of the rump and upper tail coverts bluish grey; tail feathers blue-grey, whitish on the outer webs near the base, but slightly washed with pale rufous towards the tip, all except the outer one, on either side

crossed with a broad black band near the tips, the outer feather on either side having a small black dot near the margin of the inner web, the tips of all white, of less extent on the two central feathers; forehead whitish, sides of the face and ear-coverts greyish—a blackish oblique stripe occasionally tinged with rufous, on either side of the throat from the lores to opposite the ear-coverts; throat and all the under surface white; the chest, sides, and flanks washed with pale rufous, and having narrow shaft-lines of tawny-rufous, which become blackish on the tips of the feathers, widening into a narrow streak on the flanks; axillaries white with blackish brown stripe down the centre; under surface of the wings white, the blackish markings of the upper surface showing through, the tips brown. Bill bluish horn-colour—blackish at the tips—the base of the lower mandible yellowish; cere, orbits, and legs yellow; iris, hazel. Total length 12·5 inches, wing 9·4, tail 6, tarsus 1·55, bill 0·7, culmen 0·8.

Adult female. Similar to the male, but having the head, rump, and tail rufous, of the same tint as the body, the upper tail-coverts tinged with bluish-grey towards the tip; tail rufous, the outer feathers of a paler tint, the inner webs white towards the base, all the feathers crossed with narrow alternate bars, and a subterminal broad band of black, and tipped with white, to a greater extent on the outer ones, the shafts reddish brown; the whole of the head and neck striped with shaft-lines of black, widening into somewhat triangular-shaped markings on the interscapular region, smaller scapulars and median wing-coverts having a triangular spot of black near the tip, the secondaries and larger scapulars barred on both webs with black; shoulders and smallest wing-coverts with a broad lanceolate stripe down the centre; a short broad stripe of blackish tinged with rufous on either side of the throat from the lores; facial features more distinct than in the male; the forehead, throat, and whole of the under surface white, the chest, sides, and flanks washed with pale rufous; more of the feathers striped than in the male. Total length 13·2 inches, wing 10·5, tail 6·6, tarsus 1·65, bill 0·7, culmen 0·8.

Young. The young of both sexes resemble the adult females, but have the under surface of a dull white and a more extended wash of rufous on the chest and sides, and the stripes more numerous; no tinge of bluish-grey on the upper tail coverts.

Nestling, Reg. No. B. 10157. "Apparently about a week old, taken from nest October 24th, 1883; iris blackish, bill and cere white, legs and feet yellowish." Total length 3·7 inches, tarsus 0·8, bill from forehead 0·65. Covered entirely with whitish down, longest on the head.

Habitat. Derby (N.W. Austr.); Port Denison, Wide Bay District, Richmond and Clarence Rivers Districts, New South Wales; Interior, Victoria, South Australia, West Australia, Tasmania.

Measurement of average-sized specimens from different localities.

Pandion gouldi, *Kaup, Isis* (1847), p. 270.

Pandion haliaetus var. *leucocephalus*, *Hartl., Proc. Zool. Soc.* (1867), p. 828.

Pandion leucocephalus, subsp., *Sharpe, Cat. Bds. Brit. Mus.*, vol. i, p. 451 (1874).

Adult. Upper surface of the body, wings, and tail, glossy brown, the feathers mesially shaded with a darker tint, many of the feathers of the interscapular region, back, scapulars and shoulders margined with white; primaries blackish brown, black at the tip past the notch, the inner web becoming white on the margin towards the base, some showing remains of brown bars; a few of the inner primaries, some of the adjacent secondaries and wing-coverts, narrowly margined with buffy white; under surface of the wings white, the outer series of the under-coverts blotched with brown; feathers along the outer margin of the wing from the elbow to the base of the primaries, dark brown margined with white, under surface of the secondaries and of the primaries past the notch ashy-brown, the basal marginal portion of the inner webs white barred down the centre portion with brown; head, throat, and back of the neck white, a few feathers on the nape having a streak of blackish brown down the centre; lores blackish lead-colour; ear-coverts blackish brown, which colour extends on to the sides of the neck, where the feathers are brown margined with white; chest, breast, and the lower part of the hind-neck white, much mottled with brown on the tips of the feathers, and occasionally centred with a blackish stripe; the remainder of the under surface, thighs and under tail-coverts white; tail above brown, feathers narrowly margined at the tips with white, the inner webs of a lighter brown, all except the two centre quills broadly margined and toothed with white

towards the base; under surface of the tail ashy white, tips of the feathers ashy margined with white; bill black; legs and feet lead-blue; iris yellow. Total length 25·5, wing 20, tail 9, tarsus 2·5, bill 1·7*, from nostril 1·2, culmen 1·95.

Obs.—In some specimens, apparently fully adult, the whole of the breast, chest, and sides of the neck are strongly mottled with brown; and the feathers centred with a blackish stripe; the under wing-coverts are barred with brown; the scapulars, upper wing-coverts, and quills scarcely if at all margined with white; in others the whole of the head and neck, except the ear-coverts and sides of the neck immediately behind them, is white, without any brown markings, and the dull brown on the chest takes no definite form, but is for the most part darkest on the centre of the feathers.

Habitat.—The coastal districts of Australia and Tasmania, New Guinea, Celebes, New Britain, Solomon Islands.

Measurements of average-sized specimens from different localities.

CATALOGUE
OF THE
AUSTRALIAN BIRDS
IN THE
AUSTRALIAN MUSEUM,
AT
SYDNEY, N.S.W.
PART II.
STRIGES.

BY
E. P. RAMSAY.

1890.

SECOND EDITION, WITH ADDITIONS, BY

A. J. NORTH.

1893.

PREFACE TO FIRST EDITION OF PART II.

THIS Part II of the Catalogue of the Australian Birds contains a description of all the species of the Striges or Nocturnal Birds of Prey at present known to inhabit Australia—in all 14 species—and a list of such as are contained in the collection of the Australian Museum. Opportunity has also been taken to add an Appendix to the Accipitres or Diurnal Birds of Prey, as in many instances the young of these species have not been previously described. Measurements of a large series of *Gypoictinia melanosternon*, Gould, have also been added, as well as those of authentic specimens of *Astur cruentus*, Gould.* The author has endeavoured to make these descriptions as concise as possible, but the material in some instances has not been as large as could be desired. In addition to those specimens in the Australian Museum, private collections have been examined, notably that of the Macleayan Museum and the Dobroyde Collection. In all about 200 specimens have been examined coming from various parts of Australia. We trust our correspondents in the country will endeavour to complete our National Collection by forwarding specimens; those most required are the young of the various species mentioned.

E. P. RAMSAY.

Sydney, 1890.

PREFACE TO SECOND EDITION OF PART II.

IN Part II has been added a description of the species of the Striges or Nocturnal Birds of Prey, which previously were not represented in the collection of the Australian Museum. Special thanks are due to Mr. C. W. De Vis, M.A., the Curator of the Queensland Museum, for his assistance in the loan of specimens of *Ninox humeralis* and *N. lurida*.

ALFRED J. NORTH.

Sydney, 1898.

* Which have now been incorporated in the new edition of Part I.—(A.J.N.)

1. Light Variety.

Adult. The feathers on all the upper surface of the body and interscapular region brown at the base, tinged with a more or less deep tint of orange-buff on the sides near the end, which is blackish-brown spotted or irregularly barred with white, a white spot at the tip of each feather; feathers of the wing-coverts and scapulars similar, the latter conspicuously barred with blackish-brown, the interspaces vermiculated with white, and having a spot of white at the tip; secondaries more strongly barred with from three to five blackish-brown cross-bars, whitish towards their base and on the inner webs, and margined with white at their tips where there is a distinct black spot, the interspaces between the bars being vermiculated with blackish-brown and

occasionally tinged with buff; primaries white on the inner webs and at the base, crossed with from six to eight blackish-brown bars, the interspaces vermiculated with white and blackish-brown, occasionally tinged with buff; tail feathers white, occasionally tinged with buff, crossed with six distinct blackish-brown bars, the interspaces vermiculated with zigzag lines of the same colour. Facial disc whitish and tinged with reddish-buff; a black spot in front of the eye, plumes in front of it tinged with reddish-buff. Frill feathers all white at the base, the tips buff, those over the forehead vermiculated with white and black, and often at the extreme tip having a minute white dot, or in some instances an irregular shaft line of black, the inner rows round the ears altogether white, the outer ones with an irregular shaft line and margin of black, the ends of the feathers being orange-buff, those round the throat white tinged with buff towards the tip and broadly margined with black; all the under surface of the body white, with a slight tinge of buff on the sides of the chest and on the under margin of the wing and flanks, the under wing-coverts, flanks, and thighs, and remainder of the under surface except the abdomen and under tail-coverts, marked with rather large spots, on the breast and chest a single spot, joined to a narrow shaft line which becoming distinct, forms a second spot on the breast feathers, the flank feathers have a narrow shaft line with a tear-shaped, pear-shaped, hastate or sagittate spot near the tip of the feather; the lowermost flank feathers have two distinct spots, but on the thighs the marking are obsolete.

In an apparently fully adult bird from Port Essington, there is scarcely a tinge of buff to be found, a mere trace on the scapulars and upper wing-coverts, the facial disc is white with a chocolate spot in front of the eye, quills white with five or six blackish bars best defined near the shaft of the feather, but not extending quite across the inner web, the interspaces closely vermiculated with blackish-brown and white, secondaries similarly marked, but with nearly the whole of the inner webs white, on the scapulars the bars become lost in the close vermiculations of black and white which occupy the greater portion of the feather, and the white apical spot found on those of the interscapular region is here more strongly defined and larger. The tail in this specimen has only five bars and the outer feather on either side white with obsolete vermiculations at the tip, and remains of three bars only along the shaft line.

A very old bird from South Australia is similar in plumage, but is more or less tinged with buff all over the upper surface except on some of the secondaries and innermost primaries, and on the outer tail feathers where remains of five or six cross-bars are to be found, the centre two and adjacent feathers of the tail

have six well defined bars, the whole of the under surface white, only the faintest trace of spots on the outer series of the under wing-coverts and along the flanks where there are a few minute dots, facial disc white with a small dark chocolate eye-spot.

Dark Variety.

The dark varieties of this species may be described as differing only in the general colour of the plumage; the black and white markings being the same, the apical half of the feathers being more or less strongly tinged with tints varying from orange-buff to almost a chocolate colour, conspicuously on the interspaces between the cross-bars and on the under margin of the wings, upper and under coverts and flanks; the chest is also washed with orange-buff and the ends of the gular portion of the frill more broadly margined with black. The facial disc is often as deeply tinted with rich dark orange-buff as that variety known as *Strix castanops* from Tasmania. In fact one specimen from New South Wales is, with the exception of the under tail-coverts and flanks, quite as dark as any examined from Tasmania.

Habitat. Port Darwin and Port Essington, Gulf of Carpentaria, Rockingham Bay, Port Denison, Wide Bay District, Richmond and Clarence River District, New South Wales, Interior, Victoria and South Australia, West and South-West Australia.

Measurements of average-sized specimens from different localities.

Dactylostrix castanops, Kaup, *Contr. Orn.* 1852, p. 119; *id. Trans. Zool. Soc.*, vol. iv, p. 248 (1862).

Adult male. The whole of the upper and under surface of the body of a rich chestnut inclining to chocolate-red, all the feathers of the head, neck and mantle with the ends black, sparingly, faintly and minutely vermiculated with white, a small white dot at the tip of each feather, and occasionally an obsolete cross band about the middle of the feathers adjacent to the scapulars; on the back and interscapular region they are distinctly barred as well as tipped with black, and the apical portion vermiculated with very fine white zigzag lines; upper tail-coverts similarly marked and tinted. Tail feathers deep orange-buff, with five distinct broad black bands on all except the outer two which show four only, but on the centre two the remains of a sixth band is visible on the basal portion of the feathers, the interspaces are vermiculated with black and on the extreme tip a few white dots appear. Wings: primaries dark brown, whitish towards the base on the inner webs, crossed by six broad blackish bands, the interspaces on the outer webs orange-buff or deep chestnut, and freckled with black, secondaries with a few very minute dots of white on the end of the feathers, the scapulars similar but more uniformly coloured, no white on the inner webs, the black bands irregular, some narrower and broken and with a very few white dots on the apical portion of the feathers. Facial disc rufous or deep chestnut, the eye spot black, the frill varying from chestnut to deep rufous, the plumes all more or less tipped or broadly margined with black on the gular region, they are lighter on their lower parts, but the black margins are wider. All the under surface rich chestnut, an oval spot of black at the tip of each feather, smaller on the chest and under wing-coverts, larger on the flanks; legs chestnut without spots; on the under primary coverts a large blotch of blackish-brown at the tips, bill horn yellow; feet and claws light brown, iris yellow.

Habitat.—New South Wales, Victoria, and South Australia, Tasmania.

Measurements of average-sized specimens from different localities.

Strix (Megastrix) tenebricosa, Kaup, *Contr. Orn.* (1852), p. 120; Bonap., *Rev. et Mag. de Zool.* (1854), p. 540; Kaup, *Trans. Zool. Soc.*, vol. iv, p. 249 (1862).

Megastrix tenebricosa, Gray, *Hand-l. Bds.*, vol. i, p. 53 (1869).

All the upper surface dark smoky blackish-brown, all the feathers with a small white dot near the tip, on the scapulars and wing-coverts are remains of vermicular white cross lines, primaries sooty-brown, the basal portion of the inner webs vermiculated with white, inner webs of secondaries white at the base, vermiculated with brown on their mesial portion, in some specimens showing the remains of six blackish-brown cross-bars; facial disc smoky-brown round the ears and the lower part of the frill whitish, all the feathers widely tipped with blackish-brown, a blackish spot in front of the eye; under wing and tail-coverts ashy-white at the base, the ends of the feathers sooty-black

spotted and vermiculated with white, tail sooty-brown with whitish vermiculations at the base of the feathers of the inner web and remains of six to eight indistinct cross-bars; all the under surface of the body sooty-brown, the base of the feathers ashy-white, the terminal half spotted and vermiculated with white, showing the remains of alternate white and brown cross-bars, feathers on the thighs and legs ashy-white at the base, and barred alternately with brown and white cross-bars, bristles on the feet whitish, claws black, bill yellowish, dark brown on the margins.

Specimens not quite adult have the facial disc as in the adults smoky brown, the lower and gular portion ashy-white, the inner series of the plumes white very slightly margined with brown, the outer series strongly tipped and the mesial portion of the plumes vermiculated with brown, the feathers of all the upper surface with a white subterminal spot, those of the interscapular region with remains of white vermiculations; the basal portion of the inner webs of the primaries whitish, the outer webs with six to eight obsolete cross-bars of blackish-brown and vermiculations of ashy-white on the outer webs, the secondaries white at the base, the outer webs like those of the primaries and showing remains of cross-bars on the shaft line, tail feathers dark brown and similarly marked to the secondaries, under tail-coverts brown at the ends, vermiculated with white; all feathers of the under surface ashy-white at the base, the ends crossed with irregular wavy blackish-brown bars, still younger birds are similar, with the facial disc dusky, a blackish shade all round the eye, the frill more distinctly tipped with black, the upper surface of the feathers of a clear slaty-black with much larger spots, formed by the remains of alternate black and white bars, largest upon the interscapular region and wing-coverts, scapulars with a larger white spot at the tip and crossed with numerous wavy narrow white bands, primaries with six to eight blackish bands separated by lines and vermiculations of white, outer webs strongly vermiculated with white, all the quills with a white spot at the tip, secondaries white at the base of the inner web, the remainder of the feather banded with from six to eight blackish-brown bars, the interspaces on both webs vermiculated with black and white, centre tail feathers similar but without the white bases, the outer feathers white on the inner webs toward the base, and showing remains of from six to eight blackish bars, the interspaces vermiculated with black and white, the under surface feathers of the chest dusky at the base, on the remainder of the body white crossed with three or four irregular wavy lines of slaty-black, with indications of a white spot at the tip of each feather, under wing-coverts, thighs and legs similar, the cross-bars not so well defined, the under tail-coverts with broader bars towards the end of the feathers.

Remark. Upon more adult birds the spots become very much smaller, the cross-bars on the under surface broken and the bases of the feathers dusky instead of white, the vermiculations and bars on the primaries and secondaries nearly obsolete.

Habitat. Rockingham Bay, Wide Bay District, Richmond and Clarence River District, New South Wales, Victoria, and South Australia, South Coast of New Guinea.

Nestling. "Covered with long filamentous down of a dull orange-buff colour; the feathers of the upper part, as far as developed, of a dark-brown colour, spotted near the end of the shaft of the feathers with white, the basal part of the dorsal plumes bright orange."*

Adult. Facial disc white, with a spot of blackish-brown in front of the eye, frill white except on three or four of the outer rows of feathers next the forehead which are centred and mottled with dark brown and fulvous. The feathers of the head, hind neck, back and upper tail-coverts dark brown, indistinctly freckled with white, but with a small distinct dot of white at the tip. The concealed portions of the feathers at the base fluffy and ashy-white, the mesial portion extending more or less across the tip fulvous or buff, leaving the tips alone brown; the sides of the hind neck adjacent to the frill white or occasionally tinged with buff, and with a dark brown dot near the end of the feather, some feathers nearest the forehead show remains of a dark brown shaft stripe, margins of the wings white or tinged with buff and with a dark brown spot towards the end of each feather, wing-coverts dark brown, white at the base, the mesial portion buff freckled with brown, a white spot near the tip of each feather, the inner web white except at the tip, primaries white at the base and on the inner web except at the tip, the outer web and along the shaft buff, and having the remains of four dark brown irregular bars, the ends of all the feathers vermiculated with white and brown, in some specimens merging into a white margin at the tip; the secondaries similarly marked but having the inner webs almost all white, the outer webs barred tinged occasionally with buff and their tips vermiculated with dark brown, scapulars

* Sharpe, *Cat. Bds. Brit. Mus.*, vol. ii, p. 303 (1875).

similar but more definitely freckled with darkish brown on and towards their tips, which are almost wholly brown and have a distinct subterminal spot, or a patch of white freckles, sometimes forming a white margin, two centre tail feathers and the outer webs of all except the outermost on either side, buff, crossed with four distinct dark brown bars, the end of each feather freckled with white and having an irregular spot of white at the tip, the outer feather on either side altogether white, with remains of two to four dark bands; under wing-coverts white with a small spot of dark brown near the end of each feather, the tips of the outer series freckled with brown and buff, all the under surface white with a tinge of buff on the breast, each feather having a diamond shaped, triangular, or hastate spot of blackish-brown near the tip, under tail-coverts white, with a minute dot of brown towards the ends of the feathers, some specimens are also occasionally tinged with pale buff, thighs and legs white, the lower portion of the tarsi almost bare, feet yellowish sparsely covered with stiff white hairs; bill pale straw colour; claws brown.

Remarks. In some specimens which are apparently immature, the surface of the facial disc and tips of the frill are tinged with fulvous or light orange buff, the margins and mesial portions of the feathers on all the upper surface and on the sides of the neck, on the chest, the flanks, and the tips of the under tail-coverts are washed with buff, the prevailing colour of the feathers on the upper surface is buff, with dark brown tips, with an oblong linear spot of white towards the end of the feather, the bars on the tail more defined and the tips of the feathers more distinctly freckled with white.

- Aluco delicatula*, *Sharpe, Voy. Ereb. and Terr. Birds*, p. 22.

Adult. On all the upper surface of the body the feathers are light ashy-grey, with faint zigzag and wavy lines of dark brown or blackish-brown in some specimens, tinged more or less towards their mesial portion with light tawny-buff, each with a roundish spot of white and a subterminal spot of black at the top; the mantle, wing-coverts and scapulars are similarly coloured and marked, but with the spots larger and more distinct, and the white spot margined with blackish, edges of the shoulders and margins of the wings white, and the concealed portions of the coverts white; the outer and inner margins and base of the feathers of the bastard wings pure white, the rest of the feathers freckled like those of the body but occasionally tinged more or less with tawny or orange-buff, primaries white on the inner webs and at the base, towards the end and on the outer web freckled and tipped like the rest of the feathers, occasionally tinged with orange-buff and showing the remains of four or five dark brown bars or blotches; facial disc white with a dark brown (inclining to rufous in the young) triangular patch in front of the eye which extends in a narrow line to the gape, frill white at the base, round the forehead strongly tinged with buff, minutely freckled

and tipped with white and subterminal spot of black, those surrounding the ears altogether white, and those of the inner rows below the eye and round the throat also pure white, the outer rows more or less tinged with buff at the tips and margined with a narrow cross subterminal band of black, the narrow white terminal line here disappearing; all the under surface of the body and tail pure white, with a few scattered oblong spots of blackish-brown sprinkled over the sides of the chest, under wing-coverts and flanks; the outer two feathers of the underwing-coverts with a brownish blotch at their tip; the quills white below, freckled at their tips, and having the four blackish bands of the upper surface showing through more conspicuously on the inner webs; upper tail-coverts and the feathers above freckled and spotted like those of the back except the outer feather on either side, the centre two feathers with four blackish cross bands, the others with three only, their inner webs and nearly the whole of the outer two feathers on either side white, showing only remains of the cross-bars; bill light straw yellow, darker and inclining to brown on the margins; feet with a few weak bristles of dark brown, claws brown.

Habitat. Derby, N. W. Australia; Gulf of Carpentaria, Cape York, Rockingham Bay, Port Denison, Wide Bay District, Richmond and Clarence River District, New South Wales, Interior, Victoria and South Australia, West and South-West Australia, South Coast New Guinea.

B 2 ♀ semi ad. sk.	Concord, N.S.W., Oct.	Pres.
B 3 ♀ semi ad. sk.	Parramatta River, N.S.W.	Pres.

Remarks. In some specimens not quite mature the whole of the upper surface is suffused with a rich orange-buff, particularly noticeable on the wing-coverts, scapulars, and margins of the wings; the tail, moreover, has four distinct bars on all the feathers each with a small distinct black spot near the tip, and the interspaces between the cross-bars are of a rich orange-buff; the under wing-coverts and the whole of the under surface of the body except the thighs and under tail-coverts are thickly sprinkled with blackish dots, and the sides of the chest and flanks are tinged with buff.

In a younger specimen the freckles on the wing and tail feathers are coarser, the chest appears tinged with ashy, caused by each feather having a shaft-line or spot and an irregular sub-terminal wavy line of brown across the end of the feather, these lines first become bracket-shaped and finally sagittate, these markings are always larger and more numerous in young birds. In very adult bird these spots entirely disappear.

Family BUBONIDÆ.

Austr.*, p. 62 (1896); *Sclater, List. Vert. Anim. Zool. Gard.*, 9th ed., p. 377 (1896); *Kearl., Vict. Nat.*, vol. xiii, p. 62 (1896).

Adult male. All the upper surface dull earthy-brown, the feathers of the chin and forehead white at the base, with narrow dark-brown shaft lines, those immediately over the eyes and under the bill in some specimens altogether white, base of all the feathers of the upper surface dusky, with tawny margins giving a mottled appearance, those of the hind neck mottled with one or two spots of fulvous-white, the interscapular region without spots, the back, rump and upper tail-coverts mottled with fulvous or ashy-white, indicating the remains more or less distinctly of white and fulvous cross-bars; scapulars distinctly blotched with white, the spots occasionally confluent and forming two white cross-bars, secondaries with from four to six large white blotches on the inner web, becoming fulvous on the outer web and forming alternate indistinct fulvous and brown cross-bars, primaries similarly barred, the white blotches more distinct on the inner webs, and on the margin of the outer an irregular wavy line of ashy-white or fulvous, with indications of from five to seven cross-bars on the body of the quills; tail earthy-brown, with from six to eight cross-bars of fulvous more or less distinctly indicated and becoming ashy-white on the margin of the inner webs; under tail-coverts white with a lanceolate shaft stripe and remains of one or two broken bars of brown towards the end; chest tawny with a spot of fulvous or fulvous-white on the outer edge of the feathers towards the end, on the breast the spots become elongate and form an irregular broad white margin, on the abdomen the white margin expands almost meeting at the shaft stripe and forming large white blotches on either side, fluffy feathers on the lower part of the abdomen white, legs tawny, almost rufous in some specimens; feet dark brown, claws and bill blackish-horn colour, the latter whitish on the culmen and angle of lower mandible, underwing-coverts tawny mottled with fulvous, the margins of the shoulders white; the facial disc round the eye broadest over the ear-coverts, dark brown without the white markings, the bases of the feathers behind the ear-coverts silky white in some specimens, and the bristles of the face white at the base, with dark shaft lines and black tips.

Remarks.—The broad white margins to the feathers on the under surface being almost confluent, give the appearance to the feathers of having alternate broken bands of white and rufous-brown.

Specimens from South Australia presumably of that variety called *N. marmorata*, by Mr. Gould (see Handbook, Vol. i, p. 73), are heavily blotched with white on the scapulars, which show the remains of three white cross-bars in the form of large white blotches separated by a narrow shaft line and alternate irregular bars of brown; on the under surface, the feathers, except at the base which is fluffy and dusky, are almost altogether white, having only a lanceolate or diamond-shaped shaft stripe and a triangular spot of brown at the tip; in others the flank feathers show two or three irregular bars of brown on a white ground.

Habitat. Cape York, Rockingham Bay, Port Denison, Wide Bay District, Dawson River, Richmond and Clarence River District, New South Wales, Interior, Victoria and South Australia, West and South-West Australia.

2. *Ninox ocellata*.*Spotted Owl.*

Chevêche ocellé, *Hombr. and Jacq. Voy. Pôle. Sud. Atlas*, pl. 3, fig. 2 (1843).

Athene ocellata (*Hombr. and Jacq.*), *Bonap. Consp. Av.*, tom. i, p. 42 (1850); *Jacq. and Pucher Voy. Pôle. Sud. Zool.*, tom. iii, p. 51 (1853); *Strickl. Orn. Syn.*, p. 174 (1855); *Gray, Hand-l. Bds.*, vol. i, p. 42 (1869).

Spiloglaux ocellata, *Bonap. Rev. et Mag. de Zool.* (1854), p. 544; *Gurney, jun., Cat. Bds. Prey*, p. 41 (1894).

Ninox ocellata, *Sharpe, Ibis* (1875), p. 258; *id. Cat. Bds. Brit. Mus.*, vol. ii, p. 170 (1875); *Ramsay, Proc. Linn. Soc., N.S.W.*, vol. ii, p. 178 (1877); *id. Tab. List Austr. Bds.*, p. 2 (1888).

Nestling. "Clothed in whitish down, washed with golden buff on the head, neck, and breast; the feathers, as far as developed, resembling the plumage of the adult, but the white spots on the scapulars extremely large and of an oval shape on both webs; head ochraceous, all the feathers centred and tipped with dark brown; lores and forehead whitish; ear-coverts entirely dark brown, contrasting strongly with the light-coloured head and neck; under surface of body whitish, with a few narrow central streaks of brown, rather broader on the chest, which is washed with golden buff."

Adult. "General colour above rather pale or earthy-brown, the hind neck washed with fawn colour; the head rather darker than the back, and slightly streaked with fulvous; scapulars brown like the back, broadly barred with white, occupying the greater part of the outer web, and showing very conspicuously; wing-coverts brown, the greater and median series with some distinct white oval spots; primary-coverts dark brown, with fainter indications of lighter brown bars; quills dark brown, barred across with lighter brown, the primaries externally washed with pale rufous, the light bars fading into a buffy white notch on the outer web of the outermost primaries; lower back and rump more rufous than the rest of the upper surface, the feathers having fawn-coloured bases; tail brown, the centre feathers uniform, the rest barred with fulvous on the inner web, these bars becoming gradually more distinct towards the outer feather, the last one being barred with fulvous on the inner web, and spotted with the same on the outer one; lores and frontal plumes whitish, with black shaft-lines; sides of the head fulvous, narrowly streaked with brown, and forming a tolerably distinct eyebrow; ear-coverts dark brown, contrasting with the rest of the head; cheeks whitish, as also the feathers behind the ear-coverts, these latter streaked with brown; chin whitish; rest of

under surface white, the breast yellowish, broadly streaked with rufous-brown, the abdominal feathers almost entirely white, mesially streaked with brown and broadly tipped with pale fawn colour, leg feathers fawn colour, whitish on the inner aspect; under wing-coverts ochraceous fawn, with scarcely any indications of brown markings beyond an occasional streak near the outside margin of the wing, the greater series brown, irregularly barred with fulvous, resembling the inner lining of the wing, which is brown, with large bars of fulvous on the inner lining of the web; 'bill slate-coloured, darker at tip; iris dark brown.' (Elsley, *M.S.*) Total length 13·5 inches, wing 8·6, tail 5·5, tarsus 1·65."

Observations. "Although closely allied to *N. boobook*, this is a much smaller and more rufous species, and differs especially in its fawn-coloured under parts and under wing-coverts, the latter being uniform. In some of the brown-looking examples, there are some markings or stripes of brown upon these under wing-coverts, but never so thickly distributed as in the true *N. boobook*. The difference in size may best be estimated by a comparison of two males, the specimens described not having the sexes determined."

3. *Ninox lurida*.

Ninox lurida, *De Vis, Rep. Sci. Exped. N.E. Queensland*, p. 31 (1889).

"*Adult male.* Upper surface of head and neck uniform dark brown, hind neck and back coffee-brown, with a few concealed white spots on the lateral and anterior feathers of the mantle. Lower back and upper tail-coverts uniform paler brown. Tail with two central feathers uniform, the laterals with four or five

* Sharpe, *Cat. Bds. Brit. Mus.*, vol. ii, p. 171 (1875).

distinct or nearly obsolete pale bars on the inner web. Scapulars brown, with one or two large white median spots or bars on one or both webs. Quills externally washed with greyish-brown, the outer webs with broad obscure subrufous cross-bars; the inner webs with a few obscure transverse bars, the inner ends of those near the base forming a white spot. Wing-coverts uniform brown, a little brighter than on the head. Lores and cheeks anteriorly white, the plumes with black shafts; hinder part of cheeks and ear-coverts brown like the head; a supraciliary stripe over the fore part of the orbit, white more or less stained with buff. Chin whitish, its median hinder feathers with brown shaft streaks, the laterals buff with brown centres, these forming a line behind the ear-coverts. Throat rufous-brown, obscurely spotted or streaked with buffy-white. Breast and abdomen deep rufous-brown, largely spotted with white. Under tail-coverts with a median spot on both webs, and the tips brown or buffy-brown, with one or two white median spots. Under surface of tail pale brown with four or five more or less obsolete transverse bars. Axillaries rufous or ochreous. Under wing-coverts rufous, edge of wing buffy-white or white. Under surface of wing silky-brown with the transverse bars of the quills in strong contrast. Legs rufous. Bill white, blackish below the nostrils. Mandible blue-black, yellow at the base. Total length 290, wing 225, tail 137, tarsus 38."

"*Adult female.* Like the male, but with the throat and upper breast rich chocolate brown with fulvous stripes. The tail uniform brown above and below, the quills narrowly edged with buffy-grey, and the bill black except the basal half of the culmen."

"*Loc.* Herbert Gorge, Bellenden-Ker."*

[*Ninox connivens*, and *N. boobook*, are each beautifully represented in the north-eastern and the north-western portions of the continent, by closely allied, but distinct species. The former respectively by *N. peninsularis*, and *N. occidentalis*; the latter by *N. lurida*, and *N. ocellata*. Mr. De Vis has been good enough to send me on loan for examination a female specimen of *N. lurida*. This diminutive representative of *N. boobook*, in the tropical scrubs and mountain ranges of North-eastern Queensland is in contradistinction to its northern and north-western ally, *N. ocellata*, distinguished by the intensely rich colouring of its plumage. This is more apparent on the throat, upper portion of the breast, axillaries, and under wing-coverts. Total length 11 inches, wing 8.5, tail 5, tarsus 1.4. Locality, Mulgrave River.]

Habitat. Bellenden-Ker, Sea View Range, Cardwell. (De Vis.)

Ninox maculata, Sharpe, *Ibis*, 1875, p. 258, *id. Cat. Bds. Brit. Mus.*, vol. ii, p. 174 (1875); *Ramsay, Proc. Linn. Soc., N.S.W.*, vol. ii, p. 178 (1877); *id. Tab. List Austr. Bds.*, p. 2, (1888); *North Proc. Linn. Soc. N.S.W.*, vol. iii, 2nd series, p. 1774 (1888); *id. Nests and Eggs Austr. Bds.*, App. p. 382 (1889); *Ramsay, Bull. No. 1, Dept. Agri., N.S.W.*, p. 240 (1890).

General colour above varying from rich dark brown to chocolate-brown, with white dots on the head and hind neck in pairs on either side of the shaft line near the margin of the feathers, on the mantle these spots are larger, and occasionally become confluent on the scapulars, forming two or three white cross bands or broken bars, in some instances a third bar is found on the larger scapulars towards the base of the feathers; inter-scapular region, back and upper tail-coverts without spots; secondaries dark brown showing from four to six indistinct broken cross-bars, fulvous on the outer webs, but becoming white and forming large blotches on the inner webs towards the base of the feathers; primaries similar, barred with lighter brown, and merging into a row of white spots on the inner webs, with one or two spots of white or fulvous white near the notch of the outer web, there are indications of from five to seven bars on each feather of the primaries; smaller coverts like the back without spots, the greater coverts with one or two pairs of white spots, the primary coverts without spots but show faint indications of bars; tail dark brown, with from six to eight bars of a lighter tint inclining to fulvous, but becoming white at the base of the feathers on the inner webs; chin and the basal portion of the feathers round the forehead and over the eyes white, shafts and ends of the bristles black, ear-coverts dark brown, a few feathers behind the ears occasionally margined with white; all the under surface rich chocolate-brown inclining to rufous on the abdomen each feather largely blotched with white, the blotches confluent

towards the base and forming there a white cross band, on the flanks the spots or blotches frequently form two distinct cross-bars; thighs and legs tawny, inclining to rufous; under tail-coverts fulvous white, with a lanceolate shaft line and tip of chocolate-brown, under wing-coverts tawny, the outer series and the axillaries barred irregularly with white, bill black, the culmen and tip horn colour; feet blackish-brown, the bristles almost white.

Remarks. In some aged individuals the spots upon the crown of the head disappear, and the white markings on the feathers of the hind neck are less distinct, or replaced with fulvous, and there is also a larger amount of white surrounding the bill and on the forehead.

Habitat. Wide Bay District, New South Wales, Victoria and South Australia, Tasmania.

Adult female. Plumage similar to that of male, general colour above dull dark brown, feathers of the hind neck and on the sides of the neck above spotted on either side of the feathers with white apparently the remains of cross-bars, lower part of the hind neck and the interscapular region without the white spots, rump and upper tail-coverts spotted or barred across with white towards the end of the feathers, tail dull brown like the back white at the base of each feather and on the basal portion of the inner webs of side feathers, all the feathers barred alternately with broad dark brown and narrow whitish bands, the latter becoming almost pure white on the lateral feathers, tips of all the tail feathers margined with white; on the under surface of the tail the brown and white bars are more distinct; scapulars and upper wing-coverts largely blotched, spotted or margined broadly with white showing the remains of two or three cross-bars, some of the larger scapulars with two distinct unequal cross-bars, and a roundish spot of white on either side of the feather towards the end; primaries with from six to eight dark brown bars the outer webs narrowly margined with white, and the interspaces gradually becoming white on the inner webs where the bars are most distinct; secondaries similar, with a very narrow marginal line of white and indistinct spots of white (remains of the cross-bars) on the outer web, the inner webs heavily blotched with five or six cross-bars which do not extend to the shaft, under wing-coverts similarly barred with white and dark brown alternately; facial disk incomplete, dusky, the shafts of the feathers and those over the nostrils for the most part

black, white at the base; chin ashy-white, mesially streaked with blackish-brown; concealed portions of all the feathers of the under surface dusky, surface portion dark brown with an irregular broad markin of white, which on the breast, abdomen, flanks and under tail-coverts occupies the greater portion of the exposed part of the feathers, in some specimens reducing the central portion to a more or less narrow shaft line which reaches to the extreme tip of each feather, the white on the sides of the feathers predominating; thighs and legs similarly marked, but in a less degree, and occasionally of a tawny tint; bill yellowish, the tip and margins of the mandibles and the claws blackish-brown, iris yellow.

Total length 16 inches, wing 11·9, tail 7·3, tarsus 1·9, bill from the forehead 1·3, from nostril 0·8, mid toe 1·5, culmen 1·6.

Habitat. Rockingham Bay, Port Denison, Wide Bay District, Richmond and Clarence River District, New South Wales, Interior, Victoria and South Australia, West and South-West Australia.

6. *Ninox peninsularis*.

The Cape York Winking Owl.

Ninox peninsularis, *Salvad. Ann. Mus. Civ. Gen.*, vol. vii, 1st ser., p. 992 (1875).

Ninox peninsularis, *Sharpe, Rep. Voy. H.M.S. "Alert,"* p. 11 (1884).

Ninox connivens-peninsularis, *Ramsay, Tab. List. Austr. Bds.*, p. 2 (1888).

"*Ninox*—*N. conniventi*, Lath., valde affinis, sed minor, supra obscurior, maculis gastræi obscurioribus, tibiis rufescentioribus." Long tot. 0m, 430-0m, 400; al. 0m, 275-0m, 260; caud. 0m, 170-0m, 160; rostri hiat. 0m, 031; tarsi 0m, 047. Hab. Caput York.

This species appears from the above description to be only a smaller race, otherwise almost identical with *N. connivens* of Latham, but coming from so high an authority as Count Salvadori, it is advisable to give the remarks on the species in the original:—"Sig. D'Albertis ed il Sig. Tomasinelli hanno raccolte presso Somerset tre individui de questa nuova specie, la quale differisce dalla *N. connivens*, dell' Australia meridionale per le dimensioni minori, pel color più oscuro delle parti superiori, e delle macche longitudinali delle inferiori e pel colore rossigno più vivo delle tibie e dei tarsi. Le differenze fra questa specie e la *N. connivens* appaiono evidente quando so confrontino individui delle due specie." (*Salvad. Ann. M.C. Genov.*, vol. vii, 1st ser., p. 992.) In the Voyage of the "Alert," p. 11, 1884, Mr. Sharpe remarks as follows:—"The British Museum contains a good series of this apparently well-marked species, which differs from *Ninox connivens* by the rufous streaks on the lower parts. The following is a description of Dr. Coppinger's specimen:—"

"*Adult female.* General colour above dull sooty-brown, darker on the head, which is blackish-brown, forming a tolerably distinct cap; scapulars brown like the back, with large white markings on the outer web, forming a continuous white line on each side of the back; wing-coverts almost entirely uniform, with only here and there a spot of white, a little plainer on the outer web of the median and greater coverts, the latter of which are washed with pale rufous; bastard-wing feathers and primary coverts uniform sooty brown; quills dark brown, barred on both webs with lighter brown, taking the form of whity-brown notches on the outer web; inner secondaries spotted with white on the outer and barred with white on their inner webs; lower back and rump sooty brown, with more or less concealed spots of white; upper tail-coverts deep brown; tail feathers dark brown, plainly though narrowly barred and tipped with whity-brown, these light bars being eight in number besides the terminal one; lores, base of forehead, and plumes over the eye and round the fore and lower part of the latter white, with hair-like black shaft-lines; ear-coverts dark brown; chin and cheeks white, the hinder part of the latter streaked with dusky brown; lower throat tinged with yellow and streaked with blackish centres to the feathers; remainder of under surface white, slightly tinged with yellow and broadly streaked with dark brown on the fore neck and chest and with rufous-brown on the breast and abdomen; thighs and tarsal plumes yellowish, spotted with brown; under tail-coverts white, with a few heart-shaped spots near the end of the feather; axillaries and under wing-coverts deep yellowish-buff, broadly streaked with chocolate-brown, the central markings more or less irregular in shape; quills dusky-brown, barred with white, somewhat ashy-whitish on the quills, but very pure white

on the lower series of under wing-coverts, which resemble the lower surface of the quills in appearance. Total length 15 inches, culmen 0·85, wing 10·2, tail 6·5, tarsus 1·45. Bill yellow with black tip; feet and iris yellow."

Hab. Peninsula of Cape York, N.A., Thursday Island, Torres Straits."

7. *Ninox occidentalis*.

The Western Winking Owl.

Ninox connivens-occidentalis, Ramsay, *Proc. Linn. Soc. N.S.W.*, vol. i, 2nd series, p. 1086 (1886); *id. Tab. List Austr. Bds.*, p. 2 (1888).

Hieraglaux occidentalis, Gurney, *jun., Cat. Bds. Prey*, p. 42 (1894).

A variety? from North-western Australia, distinguished under the name of *N. occidentalis* (*P.L.S., N.S.W.*, vol. i, second series, p. 1086, 1886), has the upper surface lighter and somewhat of an ashy-brown, tinged with rufous on the wings, thighs and legs of some specimens, more white on the face, forehead, and chin, and the feathers of the under surface whiter from the narrowness of the shaft lines, which are more defined and of a rufous-brown tint; the under tail-coverts white with a narrow lanceolate shaft line or spot near the end of the feathers, the white spots on the wing-coverts and scapulars are larger, but the bars on the wings and tail similar to the New South Wales specimens.

In one of the Western Australian specimens the shaft lines of the feathers of the under surface are broader, swollen on the mesial portion and expanding again at the end of the feather.

Adult male. Length 14·5 inches, wing 12, tail 7, tarsus 1·8, mid toe 1·45, bill from forehead 1·3, from nostril 0·65, culmen 1·5.

Adult female. Length 15·5 inches, wing 11, tail 6·8, tarsus 1·65, mid toe 1·4, bill from forehead 1·2, from nostril 0·8.

"Two specimens alike in plumage show a large amount of white on the upper wing-coverts, scapulars and hind-neck, than in the New South Wales or Cape York specimens; the whitish bands on the tail do not reach the shaft of the feathers; all the under surface of the body white, with a distinct well-defined band of rufous-brown down the centre of each feather; the outer webs of the primaries near the adjacent tips of the secondaries have also a faint reddish tint; the face is almost white; length 15 inches, wing 12 inches, tail 6·8 inches, tarsus about 1·4 inch; the feet small, claws comparatively weak. I believe this will prove to be a distinct species, but must be compared with some

of its New Guinea allies. For the present I place it as a western variety of *N. connivens*, which may be distinguished as *occidentalis*."

Habitat. North-western Australia.

[Specimens since obtained in the same locality prove it to be a distinct species.]

N.S.W.*, p. 240 (1890).

Hieraglaux strenuus, Gurney, *junr., Cat. Bds. Prey*, p. 42 (1894).

Young. "Head, neck and under surface of body pure white, all the feathers fluffy, apparently the remains of nestling-plumage; on the crown some brown feathers barred across with white; the forehead streaked with brown, the lores obscured by blackish bristles, as also the eyebrows and cheeks; ear-coverts dark brown, streaked with white; the under surface with a few narrow shaft-streaks of dark brown, broader on the flanks and sides of the body, the plumes on the sides of the upper breast barred with brown; the back and all the rest of the upper

surface ashy-brown, transversely barred with white, some of the bars washed with rufous; quills dark brown, tipped with white and crossed besides by fine narrower whitish bars."*

Adult male. Feathers on the forehead and over the eye white at the base, the remainder of the feathers dark brown, with a white cross band near the base, and remains of two anterior bars in the form of white spots on the webs of the feathers, some also with a narrower margin of white, on the crown of the head, nape, sides of the neck, interscapular region, back, upper tail-coverts, the bases of the feathers are dusky-brown, the exposed portion of the feathers blackish-brown, on the head and hind neck with two or in some the remains of a third white band and a narrow white margin, on the interscapular region are two distinct white bands, the remains of a third, near the base and on some a narrow subterminal line of white, on the back the bars are less distinct, and in some cases almost obsolete; the upper tail-coverts show two or three distinct white bars, and also a narrow white margin, tail feathers tipped with white and alternately crossed with broad blackish and narrow white bands, six to nine in number, the white expanding on and margining the inner webs towards the basal portions of all but the centre two feathers where they are narrowest; wing-coverts blackish-brown, the smaller narrowly barred with irregular ashy-white lines, the larger series with three broader lines, and a distinct margin of white; quills blackish-brown tipped with white and having from six to eight oblique or bracket shaped bars of fulvous becoming white on the margins of the inner webs, secondaries similarly marked but showing more white on the basal portions and inner webs, scapulars blackish-brown like the back and crossed with from three to six white bars tinged with fulvous, the last being sub-terminal and narrowest; chin and throat ashy-white with a lanceolate dark brown shaft-stripe, all the feathers of the under surface dusky at the base, the exposed portion of the feathers white crossed with two bars of dark brown and having a narrow white margin; under wing-coverts barred alternately with blackish-brown and white, under tail-coverts white with two or three irregular cross-bars, all the white cross-bars both on the upper and under surface are in most specimens tinged with fulvous, or have an anterior conterminal narrow line of fulvous, which tint is more conspicuous on the wing-coverts; the outer webs of the quills are also tinged with fulvous; bill yellowish horn-colour, the tip and margins dark brown, iris yellow, claws dark brown.

Habitat. Port Darwin, Port Essington, Cape York, Wide Bay District, Richmond and Clarence River District, New South Wales, Victoria, and South Australia.

9. *Ninox rufa*.

The Rufescent Powerful Owl.

Athene rufa, Gould, *Proc. Zool. Soc.*, 1846, p. 18; *id. Bds. Austr.*, fol. vol. i, pl. 36 (1848); Bonap. *Consp. Av. tom. i*, p. 43 (1850); Strickl. *Orn. Syn.*, p. 165 (1855); Sharpe, *Index Gould's Works*, p. 21 (1893).

Ieraglaux rufa, Kaup. *Contr. Orn.*, 1852, p. 109; *id. Trans. Zool. Soc.*, vol. iv, p. 220 (1862).

Rhabdoglaux rufus, Bonap., *Rev. et Mag. de Zool.*, 1854, p. 544.

Hieracoglaux rufus, Gould, *Hanbk. Bds. Austr.*, vol. i, p. 69, sp. 33, (1863).

"*ATHENE RUFÆ*.—*Ath. disco faciali saturatè fusco; omni corpore, suprà saturatè fusco, infrà arenaceo-rufo, multis autem lineis rufofuscis transversim fasciato.*"

"Facial disc dark brown; all the upper surface dark brown, crossed by numerous narrow bars of reddish-brown, the tints becoming paler and the barrings larger and more distinct on the lower part of the body, wings, and tail; all the under surface sandy-red, crossed by numerous bars of reddish-brown; the feathers of the throat with a line of brown down the centre; vent, legs and thighs of a paler tint, with the bars more numerous but not so decided; bill horn colour; toes yellowish, slightly clothed with feathers. Total length 20 inches, bill 1·75, wing 13·5, tail 9·5, tarsi 2·25."

"*Habitat.* Port Essington."

"*Remark.* Very powerful, nearly allied to *Athene strenua*." *

* Gould, *Proc. Zool. Soc.*, 1846, p. 18.

[Mr. G. R. Gray in his "Hand-list of Birds"* places Gould's name of *N. rufa*, as a synonym of *N. strenua*, in which he is followed by Dr. Sharpe in the Catalogue of Birds in the British Museum.† *N. rufa* is, however, a good and distinct species. Closely allied, if not identical with it, is *N. humeralis*, of Hombron and Jacquinot. Judging by a single specimen in the collection from North Australia, where the type of *N. rufa*, was obtained by Gilbert, it may be distinguished from *N. humeralis*, by its paler and more numerous barred upper surface, its ear-coverts being brown indistinctly streaked with white, instead of entirely black; the barrings on the breast sandy rufous and without any continuous lines of dark brown, and the tail-feathers being crossed with thirteen pale brown bars, instead of eight as in *N. humeralis*. Total length 19.25 inches, wing 14.5, tail 9.75, bill 1.95, tarsus 2. Gould's figure, which is not a good one, of *N. rufa*, however, exhibits the same number of cross-bars on the exposed portion of the under surface of the tail feathers as are found in *N. humeralis*, and the wing measurement in the description is almost the same as that given by Dr. Sharpe of the latter species. Should subsequent research prove these two birds alike, which I have here kept distinct, Hombron and Jacquinot's name of *N. humeralis*, must rank as a synonym of Gould's older name of *N. rufa*.]

Ninox undulata, *Ramsay, Proc. Linn. Soc., N.S.W.*, vol. iii, p. 24 (1879).

* Gray Hand-list Bds., vol. i, p. 40 (1869).

† Sharpe, Cat. Bds. Brit. Mus., vol. ii, p. 179 (1875).

Adult (type of species). General colour above dark chocolate-brown, everywhere on the upper surface crossed with indistinct bars of paler brown, rather more distinct on the scapulars and on the sides of the hind-neck; head darker than the back, and nearly uniform, the cross-bars very indistinct, excepting on the sides of the crown, above the ear-coverts, and on the sides of the neck, which are brown, distinctly rayed with fulvous cross-bars; ear-coverts black; cheeks rayed like the sides of the neck, the fore-part whitish like the lores, the latter having very distinct blackish shaft-stripes forming overhanging bristles; under surface of body orange-buff, barred across with light brown, more dingy on the chest; the abdomen white, barred across with pale orange-brown, these bars disappearing on the under tail-coverts, which are pure white, with only a slight indication of pale bars at the tips of the long feathers; leg-feathers orange-buff, with a few indistinct brown markings; under wing-coverts orange-buff or fulvous, barred across with light brown, with a brown patch near the outside of the wing, this being pure white, the lower series brown, barred with white, so as to resemble the inner lining of the quills, which are dark brown below, with pale greyish bars on the inner webs; the wings above chocolate-brown, with the same indistinct cross-bars as on the back, less distinct on the external coverts and on the least series, which are almost uniform; primary-coverts uniform blackish-brown; quills dark brown barred across with lighter brown, the secondaries paler and the cross-bars rather lighter on the extreme edge both of the primaries and secondaries; upper tail-coverts like the back, but the cross-bars a little paler; tail dark brown narrowly tipped with whitish, and barred across with lighter brown, about eight bars being distinguishable. Total length 18 inches, wing 13·4, tail 9, tarsus 1·8 (*Mus. Paris*).*

[The above is Dr. Sharpe's description of the type specimen in the Paris Museum, of which a figure is given in the Atlas of the "Voyage au Pôle Sud." It was in an Appendix to the "Annual Report on British New Guinea for 1894," that Mr. De Vis,† the Curator of the Queensland Museum, first drew attention to the existence of this species in Australia, and he there states his belief that it is identical with *Ninox rufa* of Gould. Mr. De Vis has kindly sent me for examination a specimen obtained in the scrubs of north-eastern Queensland. It is a male and is labelled Herbert Gorge, October, 1886. This specimen cannot be distinguished from typical examples of *N. humeralis*, obtained in New Guinea. In all the specimens examined belonging to this species, the ear-coverts are black and the tail feathers crossed with eight pale brown bars.

Habitat. New Guinea, North-eastern Queensland.

11. *Ninox albaria*.

The White-faced Owl.

Ninox albaria, Ramsay, *Tab. List. Aust. Bds.*, p. 36 (1888).

Spiloglaux albaria, Gurney, *junr.*, *Cat. Bds. Prey*, p. 41 (1894).

For the sake of reference, a description of this species which has been recently described from Lord Howe Island is here appended. It will be found allied to but distinct from *N. novæ-zealandiæ*, and *N. boobook*.

Specimens of a small *Ninox* from Lord Howe Island differ considerably from either of the continental forms *N. maculata* or *N. boobook*, and also from *N. novæ-zealandiæ*, to which latter it is most closely allied; this species, which I propose to distinguish under the name of *Ninox albaria*, may be briefly described:—The face, lores, forehead, chin, and upper part of the throat in some specimens snow white; the general colour of the plumage rich fawn or rusty-brown, deeper in tint on the sides of the chest and under surface and upper tail-coverts; each feather of the chest has two distinct roundish spots of white which elongate transversely and form two detached bars on the breast, but become confluent on the flanks, the feathers of the under tail-coverts are white with a terminal bar and centre shaft spot of rufous-brown; abdomen, legs, and thighs rufous-brown, paler on the outer parts; no spots on the head or hind neck; the mantle and interscapular region without spots in some, but sparingly spotted with white

on the concealed parts of the feathers in other individuals. Scapulars with two broken bands of white which sometimes take the form of oval spots on either side of the shafts of the feathers. Wings with seven or eight dull ashy bands. Centre two tail feathers without any bands, the others with about ten oblique narrow ashy bands on the inner webs only, except the outer feathers on either side, where they are just distinguishable; a few spots of white on the concealed portions of the rump and upper tail-coverts. Bill black, feet dull yellowish-brown; bristles brown. Length 12 inches, wing 8 inches, tail 6 inches, tarsus 1·7 inch, bill from forehead 1 inch. Some of the New Zealand specimens come very close to the Lord Howe Island birds, but lack the white face, lores, and chin. Should they eventually prove to be identical, this will form an interesting link, connecting the avifauna of the two islands. The Norfolk Island bird is said to be *Ninox boobook*, but it is more likely to prove to be *Ninox novæ-zealandiæ*, or perhaps the present species.

Habitat. Lord Howe Island.
